### **Mithril CEO and Managing Director, John Skeet, commented:**

*"Building on the excellent high-grade gold and silver maiden mineral resource estimate, the high recoveries of gold and silver from the flotation and leaching test work reinforce attractive project metrics for our Copalquin District in Mexico. As our study work progresses for a future development at El Refugio, we continue to see excellent results as we seek to optimise the value from this high-grade gold-silver resource. Exploration drilling to the east of the maiden mineral resource area is in progress as part of the first quarter 2022 drill program and mapping and sampling are progressing in the district, expanding our drill targets and reinforcing the district potential for multi-million-ounce gold-silver resources. We await assay results from this work."*

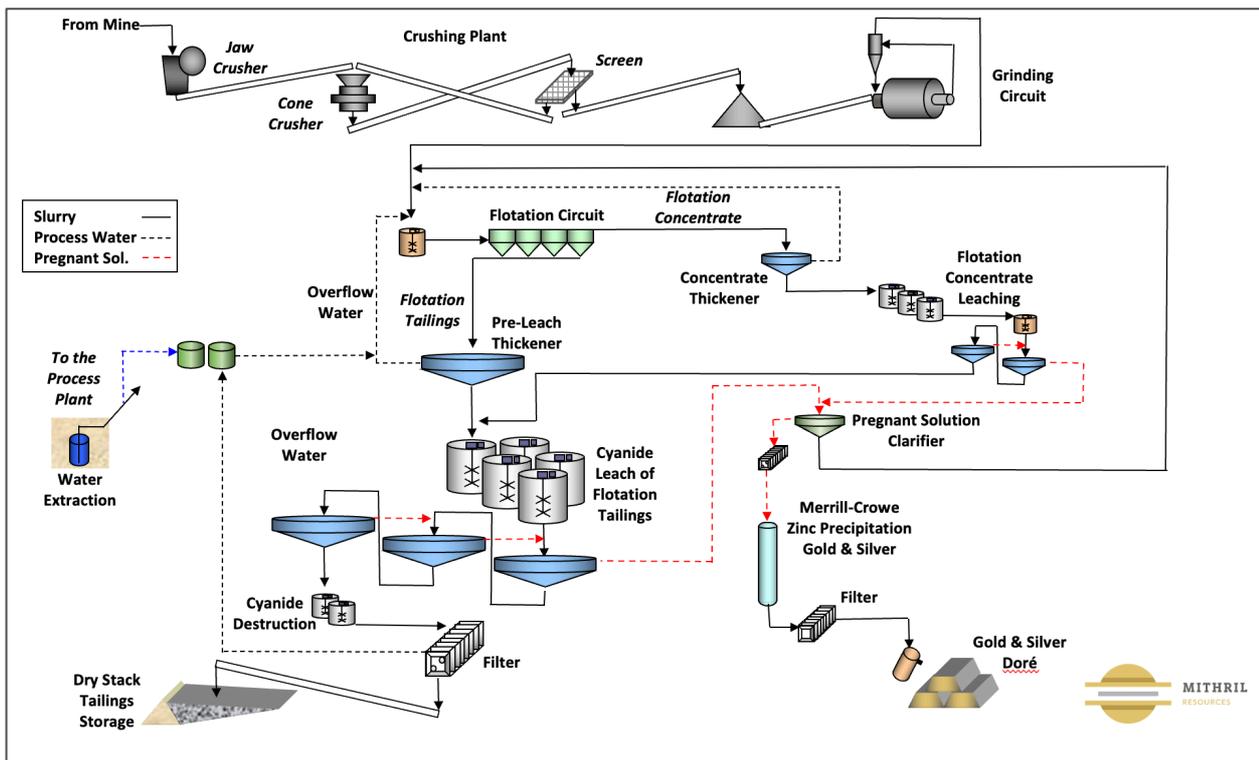

Figure 1 – Process flow sheet proposed for the El Refugio-La Soledad typical of other properties in the Sierra Madre Trend with similar geology

The sample used for the test work is a composite sample from El Refugio crushed drill core. The average grade of the composite is similar to the average grade of the maiden resource estimate. The calculated composite grade from the flotation test work is 4.52 g/t gold and 124 g/t silver.

Flotation test work has been completed using the same reagent scheme determined for the Palmarejo deposit (located in the Sierra Madre Trend and north of the Copalquin District) test work, due to the similarities in geology and mineralogy between Palmarejo and El Refugio at Copalquin.

Table 2- Summary of the flotation and the flotation product cyanide leaching recoveries giving the final gold and silver recoveries to solution.

Intensive cyanide leaching of the flotation concentrate and low-level cyanide leaching of the flotation tailings allows high recovery of silver to be achieved. Cyanide leaching of silver is slower under the typical conditions used for gold only leaching. Recovering a high proportion of the silver into a concentrate (by flotation or gravity) allows the concentrate to be leached under intensive conditions resulting in higher silver recovery. The overall recovery to solution is 96.5% for gold and 91% for silver. Gold and silver would be extracted from solution using the widely used Merrill-Crowe zinc precipitation method and then smelted to produce metal gold-silver ingots.

The process flowsheet for El Refugio-La Soledad resource material being tested is as shown below in Figure 1. This is the same flowsheet is used at similar deposits in the Sierra Madre Trend, Mexico including Palmarejo and SilverCrest Metals’ Las Chispas (under construction).

Further metallurgical test work will allow the crushing, grinding, thickening, flotation and filtration equipment sizes to be determined.

## ABOUT THE COPALQUIN GOLD SILVER PROJECT

The Copalquin mining district is located in Durango State, Mexico and covers an entire mining district of 70km<sup>2</sup> containing several dozen historic gold and silver mines and workings, ten of which had notable production. The district is within the Sierra Madre Gold Silver Trend which extends north-south along the western side of Mexico and hosts many world-class gold and silver deposits.

Multiple mineralisation events, young intrusives thought to be system-driving heat sources, widespread alteration together with extensive surface vein exposures and dozens of historic mine workings, identify the Copalquin mining district as a major epithermal centre for Gold and Silver.

Within 15 months of drilling in the Copalquin District, Mithril delivered a maiden JORC mineral resource estimate demonstrating the high-grade gold and silver resource potential for the district. This maiden resource is detailed below.

- **2,416,000 tonnes @ 4.80 g/t gold, 141 g/t silver for 373,000 oz gold plus 10,953,000 oz silver (Total 529,000 oz AuEq\*) using a cut-off grade of 2.0 g/t AuEq\***

| Sampling techniques   | <ul style="list-style-type: none"> <li>Nature and quality of sampling (eg cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc). This deposit type is common in the Sierra Madre Occidental of Mexico and is characterized by quartz veins and stockworks surrounded by haloes of argillic (illite/smectite) alteration. Veins have formed as both low-angle semi-continuous lenses parallel to the contact between granodiorite and andesite and as tabular veins in high-angle normal faults. Vein and breccia thickness has been observed up to 30 meters wide with average widths on the order of 3 to 5 meters.
