

## 19 metres at 4.2 g/t Au from 9 metres increases gold mineralisation footprint at Cape Ray Gold Project

Matador Mining Limited (ASX: MZZ; OTCQX: MZZMF; FSE: MA3) (“Matador” or the “Company”) is pleased to announce new diamond drilling results for the Cape Ray Gold Project (the “Project”) in Newfoundland, Canada. All results are from the Window Glass Hill Granite (“WGHG”) region.

### Highlights

- Diamond drilling delivers additional high-grade intercepts into the new granite margin target at the WGHG, in hole CRD214 including:
  - 19 metres at 4.2 g/t Au from 9 metres (incl. 1 metre at 30.6 g/t Au) and
  - 6 metres at 1.0 g/t Au from 34 metres (incl. 1 metre at 4.4 g/t Au) and
  - 4 metres at 1.9 g/t Au from 114 metres (incl. 1 metre at 6.3 g/t Au)
- This 19 metres at 4.2 g/t Au is the best “significant intercept” drilled at the WGHG and is outside the existing WGH Mineral Resource, highlighting the potential for additional high-grade gold domains across the granite body
- Eleven holes have now been drilled into this new granite margin target – all holes are mineralised and outside the WGH Mineral Resource, thus growing the known WGHG gold mineralisation footprint
- Assays are pending for an additional 13 diamond drill holes (1,548 metres) completed across the WGHG
- Project drilling is on-going with diamond rigs currently at the Big Pond and Benton greenfield targets

Figure 1: Cross section A - A' (looking West)

**Executive Chairman Ian Murray commented:**

*“19 metres at 4.2 g/t Au is the best gold intercept drilled in the WGHG, and better than any previously reported “significant intercepts” within the WGH Mineral Resource. What makes this intercept even more exciting is the proximity of the high-grade mineralisation to surface, and that it represents the successful definition of a new target type within the WGHG.*

*The recent power auger geochemistry results, combined with structural interpretation of our new detailed magnetics, encouraged the exploration team to test a conceptual target on the granite margin south of the WGH Mineral Resource. This structural position is similar to that of Marathon Gold’s Valentine Lake Deposits, and the granite-hosted portions of Red 5’s King of the Hills Mine (Tarmoola) in Western Australia.*

*With 11 new holes now completed into this previously untested granite margin target (all intersecting significant gold results), I am very excited by the untested potential of the remaining 6 kilometre strike length of the WGHG contact. This, combined with our ongoing targeting success delivering high-grade mineralisation near surface, augers well for the continued growth of the WGHG mineralisation footprint.*

*With assay results now flowing through, and drilling using both power auger and diamond rigs, we are anticipating regular news flow for the remainder of the year and into 2022”.*

**Figure 2: CRD216 - 1 metre at 16.4 g/t Au from 109.4 metres**

**Diamond drilling continues to extend the WGHG mineralisation footprint**

Summary of new WGHG diamond drilling significant intercepts<sup>1</sup> into the granite margin target include:

- **CRD214:**
  - 19 metres at 4.2 g/t Au from 9 metres (incl. 1 metre at 30.6 g/t Au, and 1 metre at 24.1 g/t Au) and
  - 6 metres at 1.0 g/t Au from 34 metres (incl. 1 metre at 4.4 g/t Au) and
  - 4 metres at 1.9 g/t Au from 114 metres (incl. 1 metre at 6.3 g/t Au)
- **CRD213: 7 metres at 1.1 g/t Au from 47 metres (incl. 1 metre at 5.6 g/t Au)**
- **CRD215:**
  - 4 metres at 1.1 g/t Au from 103 metres (incl. 1 metre at 2.2 g/t Au) and
  - 2 metres at 2.4 g/t Au from 163 metres (incl. 1 metre at 4.1 g/t Au)
- **CRD216: 1 metre at 16.4 g/t Au from 109.4 metres**
- **CRD217: 4 metres at 2.6 g/t Au from 70 metres (incl. 1 metre at 6.5 g/t Au)**
- **CRD218: 4 metres at 1.6 g/t Au from 47 metres (incl. 1 metre at 5.4 g/t Au)**
- **CRD219: 4.8 metres at 1.4 g/t Au from 23.2 metres (incl. 1 metre at 4.2 g/t Au)**

<sup>1</sup> Significant intercepts are calculated using a 0.5 g/t Au cut-off with no more than 4 consecutive metres of internal waste

All significant intercepts listed above are from adjacent holes drilled into a single, previously untested, granite margin target within the WGHG (Figure 3). These holes follow up on previously reported significant intercepts from the initial two holes into this target (CRD212: 8 metres at 5.1 g/t Au from 62 metres and 22 metres at 1.2 g/t Au from 91 metres, CRD210: 4 metres at 3.6 g/t Au from 74 metres<sup>2</sup>) (see Figure 1). Hole CRD214 was drilled 40 metres north of CRD212. Mineralisation remains open to the north and north-east along the granite contact.

The **19 metres at 4.2 g/t Au is the best gold intercept ever drilled within the WGHG, including the current WGH Mineral Resource** (Figure 6). Importantly, CRD214 is located outside the existing WGH Mineral Resource envelope, approximately 500 metres south-west of the high-grade central shoot within the resource, demonstrating potential for multiple high-grade domains within the much larger WGHG hosted stockwork and ladder-vein mineral system.

**Figure 3: Significant intercepts from recently completed diamond drilling into the new granite margin target area south-west of the main WGH Mineral Resource**

The WGHG is approximately 3 kilometres long and up to 800 metres wide, with less than 50% of the WGHG area having been tested by diamond drilling (Figure 4). Power auger geochemistry and surface rock chip assays across the undrilled portions of the granite indicate that gold mineralisation and associated pathfinder anomalies are present across the entire WGHG, providing significant upside potential for this gold mineral system.

A total of 11 new holes have now been completed into this previously untested area along the southern contact margin of the WGHG (see Figure 1, Figure 3 and Figure 5). The target was identified from interpretation of the recent detailed magnetics and power auger drilling as having potential for both granite hosted and shear-hosted granite contact mineralisation in the Windsor Point Group volcanoclastic rocks. While shear-hosted mineralisation along the granite margin has not yet been encountered, this new domain of granite-hosted high-grade vein mineralisation is open to the north and north-east. Drilling will continue to assess the potential for this zone to connect with the WGH Mineral Resource to the north and extend along the granite contact to the north-east which remains untested over a strike length of 500 metres along the contact.

<sup>2</sup> ASX announcement 26 August 2021

**Figure 4: WGHG area with all diamond drill collars, Mineral Resource outlines and high priority drill targets**

These new results, combined with last year's drilling in the WGH-SW area, highlight the potential that WGH mineralisation is contiguous to the south-west and south of the existing Mineral Resource with significant gold grades and thicknesses occurring outside the reported resource. It also demonstrates the potential prospectivity of the remaining 50% of the WGHG area that exhibits encouraging power auger geochemistry anomalies<sup>3</sup> but has not yet been tested by diamond drilling.

**Figure 5: Cross section B - B' (looking West)**

<sup>3</sup> ASX announcement 26 August 2021

Figure 6: CRD214 - 19 metres at 4.2 g/t Au from 9 metres

### About the Company

**Matador Mining Limited (ASX: MZZ; OTCQX: MZZMF; FSE: MA3)** is a gold exploration company with tenure covering 120 kilometres of continuous strike along the highly prospective, yet largely under-explored Cape Ray Shear in Newfoundland, Canada. The Company released a Scoping Study which outlined an initial potential seven-year mine life, with a forecast strong IRR (51% post Tax), rapid payback (1.75 year) and LOM AISC of US\$776/oz Au (ASX announcement 6 May 2020). The Company is currently undertaking the largest exploration program carried out at Cape Ray, with upwards of 45,000 metres of diamond drilling, targeting brownfield expansion and greenfields exploration. Matador acknowledges the financial support of the Junior Exploration Assistance Program, Department of Industry, Energy and Technology, Provincial Government of Newfoundland and Labrador, Canada.

### **Reference to Previous ASX Announcements**

In relation to the results of the Scoping Study which were announced on 6 May 2020, Matador confirms that all material assumptions underpinning the production target and forecast financial information included in that announcement continue to apply and have not materially changed.

In relation to the Mineral Resource estimate announced on 6 May 2020, the Company confirms that all material assumptions and technical parameters underpinning the estimates in that announcement continue to apply and have not materially changed. The Company confirms that the form and context in which the Competent Person's findings are presented have not been materially modified from the original market announcement.

In relation to the exploration results included in this announcement, the dates of which are referenced, the Company confirms that it is not aware of any new information or data that materially affects the information included in those announcements.

The Company confirms that the form and context in which the Competent Person's findings are presented have not been materially modified from the original market announcements.

### **Competent Person's Statement**

The information contained in this announcement that relates to exploration results is based upon information compiled by Mr. Warren Potma, who is an employee of Matador Mining Limited in the position of Exploration Manager. Mr. Potma is a Member of the AUSIMM and a Member of the AIG and has sufficient experience which is relevant to the style of mineralisation and type of deposit under consideration and to the activity which he is undertaking to qualify as a Competent Person as defined in the JORC Code 2012. Mr Potma consents to the inclusion in the announcement of the matters based upon the information in the form and context in which it appears.

## Appendix 2. JORC Code 2012 Table 1 Reporting

### Section 1. Sampling Techniques and Data

Criteria	Explanation	Commentary
<b>Sampling Techniques</b>	Nature and quality of sampling (eg cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc). These examples should not be taken as limiting the broad meaning of sampling.	<p>Diamond drill core samples reported in this release:</p> <p>Core was cut in half to produce a ½ core sample using a core saw.</p> <p>All sampling was either supervised by, or undertaken by, qualified geologists.</p> <p>½ core samples were then prepared on site by SGS in their Mobile Sample Preparation Unit (MSPU), a comminution facility housed in a semi-trailer unit. The entire sample was crushed to 80% pass 2mm, a 250g (rotary) split was then pulverised to generate a 250g pulp. This pulp was then shipped by SGS to their analytical facility in Burnaby BC, CA.</p> <p>Historical diamond drilling results by Matador and others have employed various sampling techniques over time. For historic drill results methodology and reporting standards, refer to Matador's announcement dated 6<sup>th</sup> May 2020.</p>
	Aspects of the determination of mineralisation that are Material to the Public Report.	<p>Not all diamond drill core is assayed. Half-core samples are selected based on geological criteria (presence of quartz veining, sulphide mineralisation and alteration mineralogy). Sample lengths are between 0.3 and 1.2m. From November 2020 routine 1m sampling intervals were implemented, with sample intervals only varied to account for post-mineralisation intrusive contacts.</p> <p>Where samples at the start or end of selected intervals return gold assays &gt;0.5g/t Au, additional samples are collected to ensure sampling across the mineralised and un-mineralised boundary.</p>
<b>Drilling techniques</b>	Drill type (eg core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (eg core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc).	NQ-sized (47.6 mm diameter) core drilling has been completed by Major's Contracting utilising a Duralite 1000 rig mounted on tracks and a Duralite 500 rig mounted on skids. Standard tube drilling methods were generally employed with triple tube drilling methods in areas of poor recovery. Drill core is oriented using a Reflex ACT III core orientation tool. Downhole surveys are recorded using a Reflex Ezy Shot survey tool.
<b>Drill Sample Recovery</b>	Method of recording and assessing core and chip sample recoveries and results assessed.	Diamond drill hole core recoveries were recorded during logging by measuring the length of core recovered per 1m interval. Core recovery was calculated as a percentage recovery of actual core length divided by expected core length. On average >98% core recovery has been achieved for the 2020 drill program to date.
	<p>Measures taken to maximise sample recovery and ensure representative nature of the samples.</p> <p>Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material.</p>	Triple tube core barrels were used in areas of expected poor recovery through the main fault zones. Some sample bias may occur in zones of poor recovery in friable material due to the loss of fine material.
<b>Logging</b>	Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies.	All diamond drill core is logged onsite by geologists to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies.
	Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc) photography.	Logging of drill core is qualitative and records lithology, grain size, texture, weathering, structure, strain intensity, alteration, veining and sulphides. Geotechnical logging records core recovery, RQD, fracture counts and fracture sets. Density measurements are recorded for each core box using standard dry/wet weight "Archimedes" technique. All drill core is digitally photographed wet.
	The total length and percentage of the relevant intersections logged.	All drill holes are logged in full.
<b>Sub-Sampling techniques and sample preparation</b>	If core, whether cut or sawn and whether quarter, half or all core taken.	<p>Diamond drill core samples reported in this release:</p> <p>Core was cut in half to produce a ½ core sample using a core saw.</p> <p>Historical diamond drilling results by Matador and others have employed various sampling techniques over time. For historic drill results methodology and reporting standards, refer to Matador's announcement dated 6 May 2020.</p>

Criteria	Explanation	Commentary																										
<b>Sub-Sampling techniques and sample preparation</b>	If non-core, whether riffled, tube sampled, rotary split, etc and whether sampled wet or dry.	N/A																										
	For all sample types, the nature, quality and appropriateness of the sample preparation technique.	<p>Diamond drill core samples reported in this release:</p> <p>Core was cut in half to produce a ½ core sample using a core saw.</p> <p>All sampling was either supervised by, or undertaken by, qualified geologists.</p> <p>½ core samples were then prepared on site by SGS in their Mobile Sample Preparation Unit (MSPU), a comminution facility housed in a semi-trailer unit. The entire sample was crushed to 80% pass 2mm, a 250g (rotary) split was then pulverised to generate a 250g pulp. This pulp was then shipped by SGS to their analytical facility in Burnaby BC, CA. This method is considered appropriate for the sample material and mineralisation style.</p> <p>Historical diamond drilling results by Matador and others have employed various sampling techniques over time. For historic drill results methodology and reporting standards, refer to Matador’s announcement dated May 6<sup>th</sup> 2020.</p>																										
	Quality control procedures adopted for all sub-sampling stages to maximise representivity of samples.	All half core samples are selected from the same side to remove sample bias, with the ½ core containing orientation line retained in the core tray.																										
	Measures taken to ensure that the sampling is representative of the in-situ material collected, including for instance results for field duplicate/second-half sampling.	No field duplicates are submitted – samples are selected for duplicate re-assaying based on assay results. Coarse rejects from original samples are re-split and pulverised for re-assay.																										
<b>Quality of assay data and laboratory tests</b>	The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total.	<p>All prepared core samples in this release were assayed for gold by 30g fire-assay with AAS finish (5ppb LOD) at SGS Burnaby British Columbia, Canada. This is a total digest method for gold and considered appropriate for mesothermal lode gold-style mineralisation.</p> <p>Prior to 2020 all Matador samples &gt;500ppb Au were re-assayed for ore-grade Ag (0.1ppm LOD), Cu, Pb, Zn (all 0.01% LOD) by 4 acid ICP-AES, and all samples &gt;500ppb Au plus nearby (shoulder) samples &gt;100ppb Au were re-assayed for Au by “total pulp metallics” (screen fire assay) also at Eastern Analytical in Springdale, Newfoundland. In 2020, all samples &gt;100ppb Au plus selected other sample intervals were submitted to Bureau Veritas (Vancouver) for 46 elements by 4 acid ICP-MS/AES analysis including Ag (0.1 ppm LOD). In 2021 all samples &gt;100ppb Au plus selected other sample intervals are analysed by SGS Burnaby for 46 elements by 4 acid ICP-MS/AES analysis including Ag (0.1 ppm LOD).</p>																										
	For geophysical tools, spectrometers, handheld XRF instruments, etc, the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc.	No new geophysical surveys are reported in this release.																										
	Nature of quality control procedures adopted (eg standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (ie lack of bias) and precision have been established.	<p>Diamond drill samples: Certified reference material (CRM) samples sourced from OREAS were inserted every 25 samples and coarse blank samples have been inserted after expected high grade samples.</p> <table border="1"> <thead> <tr> <th>Standard</th> <th>Expected Au_ppm</th> <th>Expected Ag_ppm</th> </tr> </thead> <tbody> <tr> <td>OREAS 216b</td> <td>6.66</td> <td></td> </tr> <tr> <td>OREAS 229b</td> <td>11.95</td> <td></td> </tr> <tr> <td>OREAS 231</td> <td>0.542</td> <td>0.177</td> </tr> <tr> <td>OREAS 239</td> <td>3.55</td> <td></td> </tr> <tr> <td>OREAS 608</td> <td>1.21</td> <td>14.7</td> </tr> <tr> <td>OREAS 61f</td> <td>4.6</td> <td>3.64</td> </tr> <tr> <td>OREAS 62f</td> <td>9.71</td> <td>5.47</td> </tr> <tr> <td>OREAS 216b</td> <td>6.66</td> <td></td> </tr> </tbody> </table>	Standard	Expected Au_ppm	Expected Ag_ppm	OREAS 216b	6.66		OREAS 229b	11.95		OREAS 231	0.542	0.177	OREAS 239	3.55		OREAS 608	1.21	14.7	OREAS 61f	4.6	3.64	OREAS 62f	9.71	5.47	OREAS 216b	6.66

<b>Verification of sampling and assaying</b>	The verification of significant intersections by either independent or alternative company personnel.	All assays are reviewed by Matador Mining and significant intercepts are calculated as composites and reported using two cut-off grades (0.2 and 0.5 g/t Au). A maximum of 4m consecutive internal waste is allowed in composites. All significant intercepts are calculated by Matador’s data base manager and checked by senior geologist and the Competent Person.																										
	The use of twinned holes.	None of the new holes reported in this release twin existing drill holes.																										

Criteria	Explanation	Commentary
<b>Verification of sampling and assaying</b>	Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols.	All drill hole logging is completed on digital logging templates with built-in validation. Logging spreadsheets are uploaded and validated in a central MS Access database. All original logging spreadsheets are also kept in archive.
	Discuss any adjustment to assay data.	No assay data was adjusted, and no averaging was employed.
<b>Location of data points</b>	Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation.	Drill hole collars are located using handheld GPS with 3-5m accuracy. A Reflex EZ Trac downhole survey tool is used to record drill hole deviation. All downhole surveys are corrected to True Azimuth based on magnetic declination of 18.2 degrees.
	Specification of the grid system used	Drill hole collars are recorded in UTM NAD 83 Zone 21N.
	Quality and adequacy of topographic control	SRTM (satellite) DEM data provides approximately 5m topographic elevation precision across the entire project. A drone survey within the Window Glass Hill area was also completed in 2019 providing centimetre accuracy but has been down-sampled to provide a manageable data file size with sub-metre precision for XYZ coordinates.
<b>Data spacing and distribution</b>	Data spacing for reporting of Exploration Results.	Drill hole spacing for the 2021 drill program is variable as most drilling to date is either first pass drilling of new exploration targets or step-out brownfields exploration targeting along strike from existing Resources. In general, drill hole collar spacing on new exploration traverses has been between 40-80m with hole depths designed to provide angle-overlap between holes on the drill traverse (i.e. the collar of each hole is located vertically above the bottom of the preceding hole). Where multiple lines of drilling have been completed, drill sections are generally between 80 – 160m apart.
	Whether the data spacing and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied.	Within the existing Mineral Resources, the drill hole spacing is considered sufficient to establish the required degree of geological and grade continuity for the estimation of the previously reported Mineral Resources.  The new exploration drilling completed to date this year is, in general, not yet sufficient to support Mineral Resource estimation.
	Whether sample compositing has been applied.	As all samples are from drill core, no physical compositing of samples has been applied. Methods used for numeric/calculated compositing of grade intervals are discussed elsewhere.
<b>Orientation of data in relation to geological structure</b>	Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type.	Following structural review of detailed outcrop mapping at Window Glass Hill and structural logging of veins from all available oriented diamond drill core for the Window Glass Hill area it has become apparent that in addition to the shallowly SW dipping stacked vein system hosting gold at WGH, there are also at least two subordinate mineralised vein orientations potentially forming a stockwork 1) steeply south-east dipping, and 2) moderately west to south-west dipping. Consequently, most drill holes in 2020 have been oriented at either -50 or -60 degrees towards 360 degrees (Grid North). Whilst this is not an optimal orientation of the west-dipping vein set it does provide representative sampling of the other two sets. Selected holes were also drilled at other orientations where required to optimally intersect target structures.
	If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material.	Many of the historic Window Glass Hill drill holes were vertical (or drilled steeply towards the NNW). This orientation is considered appropriate for the main shallowly SW-dipping mineralised vein set at WGH. However, these holes have under-sampled the two steeply dipping vein sets mentioned above (especially the west dipping set) potentially resulting in an underestimation of contained gold associated with these two vein sets. Additional drilling is planned to test and hopefully quantify any potential grade under-estimation bias.
<b>Sample Security</b>	The measures taken to ensure sample security.	All core sample intervals are labelled in the core boxes with sample tags and aluminium tags. Cut core samples are collected in plastic bags labelled with the sample number and a sample tag. Plastic sample bags are collected in large rice bags for despatch with 10 samples per rice bag. Rice bags are labelled with the company name, sample numbers and laboratory name, and are delivered to the onsite SGS MSPU by Matador Staff and contractors.
<b>Audits or reviews</b>	The results of any audits or reviews of sampling techniques and data.	All QAQC data is reviewed to ensure quality of assays; batches containing standards that report greater than 2 standard deviations from expected values are re-assayed.

## Section 2 Reporting of Exploration Results

(Criteria listed in the preceding section also apply to this section.)

Criteria	JORC Code explanation	Commentary																																																																																																																																																											
<b>Mineral tenement and land tenure status</b>	<p>Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings.</p> <p>The security of the tenure held at the time of reporting along with any known impediments to obtaining a licence to operate in the area.</p>	<p>Matador owns 100% of all tenements on the Cape Ray Gold Project, which is located approximately 20km northeast of Port aux Basques, and 100% of all tenements on the Hermitage Project located approximately 50km North of Grey River, Newfoundland, Canada. 	<p>The security of the tenure held at the time of reporting along with any known impediments to obtaining a licence to operate in the area.</p>	<p>The claims are in good standing</p> <p>Permits that will potentially be required for exploration work include a Surface Lease and Mineral Exploration Approval both issued by the Newfoundland Department of Natural Resources, Mineral Development Division. A Water Use Licence has been acquired from the Newfoundland Department of the Environment and Conservation, Water Resources Division, as well as a Certificate of Approval for Septic System for water use and disposal for project site facilities.</p>
<p><b>Exploration done by other parties</b></p>	<p>Acknowledgment and appraisal of exploration by other parties.</p>	<p>The Cape Ray Gold Deposit was initially discovered in 1977 by Rio Canada Exploration Limited (Riocanex). Since that period the area has been the subject of numerous academic and government geological studies, and exploration by various mining companies. Historical work is summarised in Matador Announcement 19<sup>th</sup> July 2018.</p>
<p><b>Geology</b></p>	<p>Deposit type, geological setting and style of mineralisation.</p>	<p>The Cape Ray Project lies within the Cape Ray Fault Zone (CRFZ), which acts as a major structural boundary and hosts the Cape Ray Gold Deposits; zones 04, 41 and 51 (Central Zone), Window Glass, Big pond and Isle Aux Morts.</p> <p>The CRFZ is approximately 100km long and up to 1km wide extending from Cape Ray in the southwest to Granite Lake to the Northeast.</p> <p>Areas along and adjacent to the southwest portion of the Cape Ray Fault Zone have been subdivided into three major geological domains. From northwest to southeast they include: The Cape Ray Igneous Complex (CRIC), the Windsor Point Group (WPG) and the Port aux Basques gneiss (PABG). These units are intruded by several pre-to late-tectonic granitoid intrusions.</p> <p>The CRIC comprises mainly large mafic to ultramafic intrusive bodies that are intruded by granitoid rocks. Unconformably overlying the CRIC is the WPG, which consists of bimodal volcanics and volcanoclastics with associated sedimentary rocks. The PABG is a series of high grade, kyanite-sillimanite-garnet, quartzofeldspathic pelitic and granitic rocks intercalated with hornblende schist or amphibolite.</p> <p>Hosted by the CRFZ are the Cape Ray Gold Deposits consisting of three main mineralised zones: the 04, the 41 and the 51 Zones, which have historically been referred to as the "Main Zone". These occur as quartz veins and vein arrays along a 1.8 km segment of the fault zone at or near the tectonic boundary between the WPB and the PABG.</p> <p>The gold bearing quartz veins are typically located at or near the southeast limit of a sequence of highly deformed and brecciated graphitic schist. Other veins are present in the structural footwall and represent secondary lodes hosted by more competent lithologies.</p>

Criteria	JORC Code explanation	Commentary
		<p>Gold bearing quartz veins at the three locations are collectively known as the “A vein” and are typically located at (41 and 51 Zones) or near (04 Zone) the southeast limit of a sequence of highly deformed and brecciated graphitic schist of the WPG. The graphitic schists host the mineralisation and forms the footwall of the CRFZ. Graphitic schist is in fault contact with highly strained chloritic schists and quartz-sericite mylonites farther up in the hanging wall structural succession.</p> <p>The protolith of these mylonites is difficult to ascertain, but they appear to be partly or totally retrograded PABG lithologies. Other veins (C vein) are present in the structural footwall and represent secondary lodes hosted by more competent lithologies.</p> <p>In the CRGD area, a continuous sequence of banded, highly contorted, folded and locally brecciated graphitic schist with intercalations of chloritic and sericite-carbonate schists and banded mylonites constitutes the footwall and host of the mineralised A vein. The banded mylonites are characterized by cm-wide siderite-muscovite-quartz-rich bands within graphitic chlorite-quartz-muscovite schist. The mylonites are commonly spatially associated with local Au-mineralised quartz veins, vein breccias and stringer zones.</p> <p>The graphitic schist unit becomes strongly to moderately contorted and banded farther into the footwall of the fault zone, but cm- to m-wide graphitic and/or chloritic gouge is still common. The graphitic schist unit contains up to 60% quartz or quartz-carbonate veins. At least three mineralised quartz breccias veins or stockwork zones are present in the footwall of the 41 Zone and these are termed the C vein. The thickness of the graphitic-rich sequence ranges from 20-70m but averages 50-60 m in the CRGD area.</p> <p>The CRGD consists of electrum-sulphide mineralisation that occurs in boudinaged quartz veins within an auxiliary shear zone (the “Main Shear”) of the CRFZ. The boudinaged veins and associated mineralisation are hosted by chlorite-sericite and interlayered graphitic schists of the WPG (Table 7.1), with sulphides and associated electrum occurring as stringers, disseminations and locally discrete massive layers within the quartz bodies.</p> <p>The style of lode gold mineralisation in the CRGD has a number of characteristics in common with mesothermal gold deposits. The relationship of the different mineral zones with a major ductile fault zone, the nature of quartz veins, grade of metamorphism, and alteration style are all generally compatible with classic mesothermal lode gold deposits.</p>
<p><b>Drill hole Information</b></p>	<p>A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drill holes:</p> <ul style="list-style-type: none"> <li>• easting and northing of the drill hole collar</li> <li>• elevation or RL (Reduced Level – elevation above sea level in metres) of the drill hole collar</li> <li>• dip and azimuth of the hole</li> <li>• down hole length and interception depth</li> <li>• hole length.</li> </ul> <p>If the exclusion of this information is justified on the basis that the information is not Material and this exclusion does not detract from the understanding of the report, the Competent Person should clearly explain why this is the case.</p>	<p>All diamond drill hole collar co-ordinates, hole orientations, depths and significant intercepts are reported in Appendix 1.</p>

Criteria	JORC Code explanation	Commentary
<b>Data aggregation methods</b>	<p>In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (eg cutting of high grades) and cut-off grades are usually Material and should be stated.</p> <p>Where aggregate intercepts incorporate short lengths of high-grade results and longer lengths of low-grade results, the procedure used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail.</p> <p>The assumptions used for any reporting of metal equivalent values should be clearly stated.</p>	<p>Significant intercepts are determined based on &gt;1m composite samples as length-weighted averages and are reported with a cut-off grades of 0.2 g/t Au and 0.5g/t Au with a maximum of 4m of consecutive internal waste dilution.</p> <p>Where significant short intervals of high-grade material form part of a broad lower grade composite, these intervals are explicitly stated in the drill hole information table.</p> <p>No metal equivalent values are reported.</p>
<b>Relationship between mineralisation widths and intercept lengths</b>	<p>These relationships are particularly important in the reporting of Exploration Results.</p> <p>If the geometry of the mineralisation with respect to the drill hole angle is known, its nature should be reported.</p> <p>If it is not known and only the down hole lengths are reported, there should be a clear statement to this effect (eg 'down hole length, true width not known').</p>	<p>All intercepts reported as downhole lengths. The stockwork and sheeted nature of mineralised veins within the Window Glass Hill Granite make it difficult to estimate the true thickness of any intersection as intersections generally comprise multiple veins, often at differing orientations. The thicker high grade flat lying veins at WGH are more predictable with drill holes generally intersecting these veins at a relatively high angle (alpha angles of 60-90 degrees)</p>
<b>Diagrams</b>	<p>Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported. These should include, but not be limited to a plan view of drill hole collar locations and appropriate sectional views.</p>	<p>See body of announcement for diagrams.</p>
<b>Balanced reporting</b>	<p>Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced to avoid misleading reporting of Exploration Results.</p>	<p>All diamond drill holes have been reported in Appendix 1 (including holes with no significant results (NSR)).</p>
<b>Other substantive exploration data</b>	<p>Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples – size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances.</p>	<p>All relevant/material data has been reported</p>
<b>Further work</b>	<p>The nature and scale of planned further work (eg tests for lateral extensions or depth extensions or large-scale step-out drilling).</p> <p>Diagrams clearly highlighting the areas of possible extensions, including the main geological interpretations and future drilling areas, provided this information is not commercially sensitive.</p>	<p>Follow up mapping, power auger drilling and diamond drilling are critical next steps to assess and validate multiple high priority greenfields targets. Ongoing extensional and infill drilling is also planned in and around existing Mineral Resources.</p>
