# WILDCAT SET TO ACQUIRE RICH MINERALISED LCT PEGMATITE FIELD IN THE WORLD CLASS PILBARA LITHIUM PROVINCE WA

### **Highlights**

- Wildcat has entered into a conditional, binding agreement to acquire 100% of the Tabba Tabba Tantalum Mine and Lithium-Tantalum Project, 50km from Port Hedland in the Pilbara, WA
- Historical exploration defined a very high-grade, pegmatite-hosted tantalum deposit, with no focus on the exploration potential for lithium
- Previous drilling intersected high-grade lithium including 8m at 1.42%
   Li<sub>2</sub>O from 4m (TDRC02) (limited assaying for lithium)
- Wildcat set to welcome new major shareholders post deal completion

**Wildcat Resources Limited (ASX: WC8)** ("Wildcat" or "Company") is pleased to announce it has entered into an exclusive, binding, conditional agreement to acquire 100% of the **Tabba Tabba Lithium-Tantalum Project** ("the Project") from Global Advanced Metals Wodgina Pty Ltd ("GAM"). The acquisition complements Wildcat's already commanding landholding in the region.

Tabba is a group of **granted mining leases**, with large areas of outcropping pegmatites and a high-grade tantalum deposit with a Mineral Resource estimate of **318Kt at 950ppm Ta<sub>2</sub>O<sub>5</sub>**. The project is located just 50km from Port Hedland, WA and is nearby some of the world's largest hard-rock lithium mines. Previous exploration focussed on tantalum mineralisation and the majority of samples were not assayed for lithium. However, mapping, sampling, and drilling has defined extensive occurrences of lithium-caesium-tantalum ("LCT") mineralised pegmatites with several intersections of high-grade lithium (> 2.0% Li<sub>2</sub>O) mineralisation.

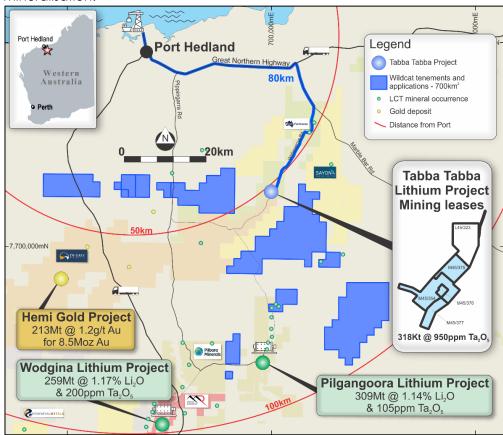

Figure 1 – Location of the Tabba Tabba Project relative to infrastructure and Wildcat's existing exploration tenements at the Bolt Cutter Project, Pilbara, WA

**Wildcat Resources Ltd** 

Wildcat Resources is a company focussed on discovery with strategic landholdings in world class provinces in Australia.

The company has key landholdings for gold in the Lachlan Fold Belt (NSW), gold and lithium in the Mallina Province – Pilbara (WA), and greenfields exploration projects regionally in WA.

# ASX Announcement 17 May 2023

Executive Director Matthew Banks commented "This is a big step forward for the Company to acquire such a highly prospective lithium exploration project that adds to our already large ground position in the World Class Pilbara Lithium Province. Tabba Tabba is a proven LCT pegmatite system that was within Pancontinental's tantalum portfolio in the 1980's, along with Pilgangoora (Pilbara Minerals Ltd), Wodgina (Mineral Resources Ltd) and Yinnertharra (Delta Lithium Ltd). Our technical team believes there is significant exploration upside at Tabba Tabba, it is located within granted mining leases and we have approval for a 200 hole drill program. On deal completion we will welcome a range of major shareholders to the Company and look forward to following through with discovery-focussed drill programs earmarked for 2023."

### Tabba Tabba – Background and Development Opportunity

#### **History**

Alluvial tin and tantalum mining have occurred at Tabba Tabba since the early 1900s. Exploration by Pancontinental Mining Ltd in the 1980s resulted in the discovery of high-grade pegmatite-hosted tantalum mineralisation at Tabba Tabba, and at the Wodgina and Pilgangoora Projects. At the time the exploration and mining focus was tin and tantalum, and the projects were largely unexplored for lithium.

Various feasibility studies and minor tribute mining, including by Sons of Gwalia Ltd, occurred throughout the 1990s and early 2000s. In 2007, key assets were purchased by Resource Capital Funds and the tantalum projects were subsequently transferred to GAM.

Trial mining for tantalum by Pilbara Minerals Ltd in a 50/50 JV with Nagrom under a 5-year tantalum mining and offtake agreement with GAM commenced in 2015 but was abandoned due to unspecified tantalum plant commissioning issues. The tantalum mine and infrastructure were rehabilitated between 2016 and 2019, and the tenements have remained in GAM's ownership since.

Nearly forty (40) outcropping pegmatite bodies have been mapped within the mining leases at Tabba Tabba, however only one was extensively drilled and most of the samples were not assayed for lithium. The lack of drilling offers significant upside for Wildcat for lithium exploration.

The pegmatite body that contains the high-grade Tabba Tabba tantalum deposit has a Mineral Resource estimate of 318Kt at 950ppm Ta<sub>2</sub>O<sub>5</sub> for 666,200lbs Ta<sub>2</sub>O<sub>5</sub> at a 400ppm lower cut-off grade<sup>1</sup>. The resource drilling on the Tabba Tabba pegmatite was only to 35m depth, and the mineralisation is open in most directions. With regard to the reported tantalum resource, the information is extracted from the report entitled "Pilbara Reports Updated Mineral Resource for Tabba Tabba Tantalum Project, WA created on 19th January 2015 and is available to view on <a href="https://cdn-api.markitdigital.com/apiman-gateway/ASX/asx-research/1.0/file/2995-01591791-6A706666?access token=83ff96335c2d45a094df02a206a39ff4">https://cdn-api.markitdigital.com/apiman-gateway/ASX/asx-research/1.0/file/2995-01591791-6A706666?access token=83ff96335c2d45a094df02a206a39ff4</a>. The Company confirms that it is not aware of any new information or data that materially affects the information included in the original market announcement.

The only drill holes outside of the Tabba Tabba tantalum deposit were drilled in 2013 and intersected a pegmatite that returned 8m at 1.42% Li<sub>2</sub>O from 4m (TDRC02), 16m at 0.9% Li<sub>2</sub>O from 10m (TDRC03) and 1m at 2.00% Li<sub>2</sub>O from 40m to EOH (TDRC04)<sup>2</sup> (Appendix 1, Table 2). This single pegmatite outcrop is 300m long (Figure 2).

The rest of the mapped pegmatites have yet to be drilled. Field checking by Wildcat confirmed extensive pegmatites coincident with the detailed geological mapping as shown on Figure 2.

# ASX Announcement 17 May 2023

The Company notes that extensive, grid drilling has been completed by FMG on the northern extensions of the pegmatite field in the adjoining tenement underlying what is now miscellaneous license L45/323 at Tabba Tabba (Figure 2).

#### Lithium Exploration and Project Potential

Elongate crystal textures observed in pegmatite outcrop at Tabba Tabba are shown on Figure 3. The mineral species and geochemistry of these will be determined by Wildcat during exploration at Tabba Tabba this year.

Wildcat has received approval from the Department of Mines, Industry, Regulation and Safety ("DMIRS") for a comprehensive program of work ("POW") and has planned 6,000m of RC and diamond drilling to test the extent of lithium-tantalum mineralisation throughout the leases. The objective is to rapidly discover and delineate resources that could be developed in the near term.

The Tabba Tabba Project has very favourable geological attributes for exploration and evaluation activities as well as for future mine development. The Project comprises active mining leases, with an approved mine plan for the tantalum resource. Tabba Tabba is also one of the best located lithium exploration projects in terms of access to services, transport, and shipping infrastructure in Western Australia. It occurs adjacent to Wallareenya Road and is only 80km by road to the Port Hedland port. It is 60km by road to the Pilgangoora Lithium Mine processing plant and 97km by road to the Wodgina Lithium Mine processing plant.

The Tabba Tabba Lithium Project provides Wildcat with an advanced exploration opportunity and with exploration success, a potential near-term development project. This complements the Company's early-stage exploration ground at its large and prospective Bolt Cutter Project.

The Tabba Tabba pegmatite field is hosted by greenstone rocks proximal to the regionally significant Tabba Tabba Shear Zone, a major long-lived structure that separates the East and West Pilbara Blocks<sup>3</sup>. The structure has a long history of displacement and reversals of movement due to different tectonic events. This has resulted in significant ground preparation of the host rocks, creating favourable conduits and trap sites for pegmatite melts migrating away from their source. Late, highly fractionated monzogranites of the Split Rock Supersuite have a spatial relationship to the LCT pegmatites in the Pilbara and are considered the source of mineralised pegmatites in the district<sup>4</sup>. Several plutons of Split Rock Supersuite granites are intruded proximal to the Tabba Tabba pegmatite field providing ample sources for enriched pegmatite melts.

The regional setting is ideal for the formation of fractionated lithium and tantalum mineralised LCT pegmatites. The potential for the Tabba Tabba pegmatite field to host a significant lithium mineralisation is further supported by the occurrence of high-grade lithium in the few drill samples that have been assayed for lithium and in many of the rock chips samples obtained during Wildcat's due diligence work.

<sup>&</sup>lt;sup>3</sup> K.A. Beintema, P.R.D. Mason, D.R. Nelson, S.H. White, and J.R. Wijbrans. 2003. New constraints on the timing of tectonic events in the Archaean Central Pilbara Craton, Western Australia. Journal of the Virtual Explorer 13

<sup>&</sup>lt;sup>4</sup> Sweetapple, M.T. 2017. A review of the setting and internal characteristics of lithium pegmatite systems of the Archaean North Pilbara and Yilgarn Cratons, Western Australia. Extended Abstract, Granites 2017 conference. Bulletin 65. Australian Institute of Geoscientists

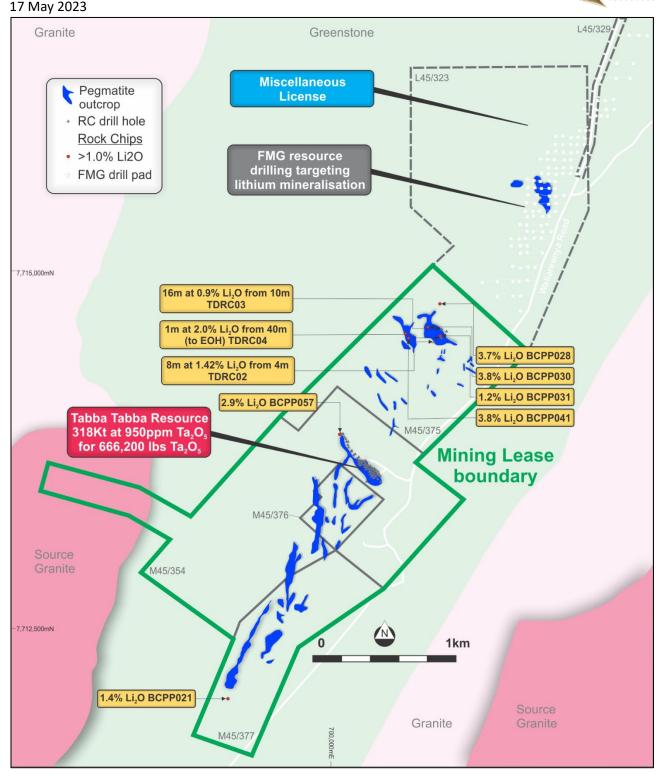

Figure 2 – Tabba Tabba mining lease area in green showing the mapped outcropping pegmatites at surface, the pegmatite that hosts the Tabba Tabba tantalum resource, surfaces rock chips >1%  $Li_2O$  obtained during DD (listed in Appendix 2, Table 2), and lithium intercepts in the drilling in the pegmatite to the north.

The Bolt Cutter package now comprises 475km² of 100% owned, granted and application tenements and 230km² of tenements under application and subject to a ballot. The tenements are located proximal to numerous Split Rock Supersuite granite plutons (enriched source rocks) and straddle major structures that form prospective corridors for lithium mineralised LCT pegmatites that include the Wodgina, Pilgangoora and Tabba Tabba pegmatite fields; and numerous other LCT occurrences. The western Bolt Cutter tenements straddle the Berghaus Shear in a prospective gold mineralisation corridor that includes the Hemi Gold Deposit (Figure 4).

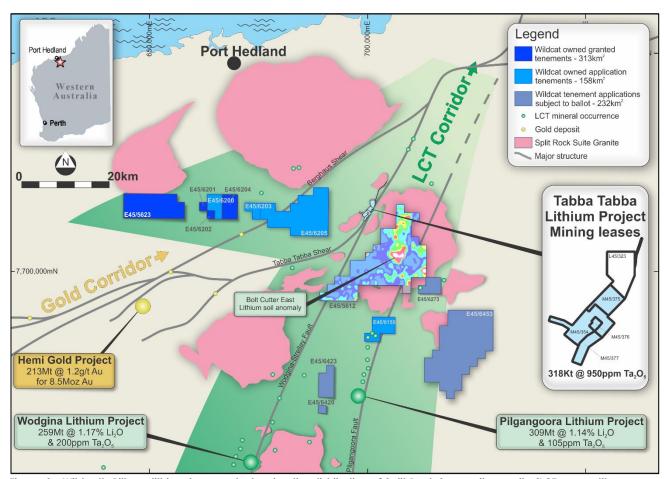

Figure 4 – Wildcat's Pilbara lithium tenements showing the distribution of Split Rock Supersuite granite (LCT pegmatite source rocks), major structures, mineral corridors, and major lithium and gold deposits. The location of the Bolt Cutter East lithium soil anomaly is also shown<sup>5</sup>

### **Key Terms of the Acquisition Agreement**

The Company has entered into an exclusive, conditional, binding agreement ("Agreement") with GAM under which GAM has agreed to sell 100% interest in the key WA mining tenements M45/354, M45/375, M45/376, M45/377, L45/323 and L45/329 ("Tabba Tabba Tenements"). Under the Agreement, GAM also has a reasonable endeavours obligation to transfer tenement M45/374 to

<sup>&</sup>lt;sup>5</sup> ASX announcement 29 June 2022: <a href="https://www.investi.com.au/api/announcements/wc8/b56c1b41-9b7.pdf">https://www.investi.com.au/api/announcements/wc8/b56c1b41-9b7.pdf</a>

#### 17 May 2023

Wildcat if a legal or beneficial interest in that tenement is ultimately secured by GAM or a related party after settlement. This additional tenement is not considered material, does not form part of the Tabba Tabba Tenements, and if it is ultimately transferred to the Company under the Agreement, the transfer price would be nominal (\$1).

The consideration payable for the acquisition of the Tabba Tabba Tenements ("Consideration") comprises:

- a) Consideration securities to be issued to GAM comprising:
  - i) 186,660,512 Shares in Wildcat; and
  - ii) 62,220,171 Performance Rights that will vest and be capable of exercise into Shares (on a 1 for 1 basis) upon Wildcat announcing an Inferred Mineral Resource on the Tabba Tabba Project of equal to or greater than 100,000 tonnes of contained Li<sub>2</sub>O, with a cut-off grade of 0.1% Li<sub>2</sub>O.
- b) In addition to the Consideration Securities, Wildcat will:
  - i) grant to GAM a 0.75% gross revenue royalty with respect to the sale of lithium products extracted from the Tabba Tabba Project;
  - ii) grant to GAM a 1% gross revenue royalty with respect to the sale of tantalum products extracted from the Tabba Tabba Project ("Tantalum Royalty"); and
  - iii) assume GAM's obligations under an existing 1% net smelter royalty with respect to the sale of tantalum products extracted from the Tabba Tabba Project granted in favour of RCF Management L.L.C ("RCF" and "RCF Royalty"),

(together, the "Royalties").

Wildcat will grant first ranking security interests over the Tabba Tabba Project tenements to GAM and RCF to secure payment of each of the Royalties and GAM's other mineral rights that will each be subordinated in the event WC8 secures project financing via a senior loan ("Royalty Security")

GAM is granted a first right of refusal to purchase tantalum concentrate that is extracted from the Tabba Tabba Project at an agreed discount of 10% to market price in respect of secondary tantalum concentrate, and an agreed discount of 45% to market price of secondary tantalum concentrate in respect of primary tantalum concentrate.

GAM is granted an option to fund, build and own a tantalum recovery plant to extract the tantalum recovered from Tabba Tabba only if:

- a) Wildcat elects to carry out mining operations at the Tabba Tabba Project; and
- b) Wildcat elects to construct a processing and recovery plant on or around the Tabba Tabba Project that does not incorporate tantalum recovery capability (i.e. does not see commercial value in the tantalum).

In the above circumstance Wildcat will operate the Tantalum Circuit, and any tantalum product that is processed through the Tantalum Circuit will be owned by GAM although GAM will reimburse Wildcat for the cost of operating the Tantalum Circuit. The Tantalum Royalty will not apply with respect to any tantalum owned by GAM that is processed though the Tantalum Circuit. If Wildcat elects to process tantalum product produced from areas other than the Tabba Tabba Tenements through the Tantalum Circuit, Wildcat will pay GAM a usage charge.

### **Conditions Precedent**

The agreement to sell the Tabba Tabba Tenements in return for the payment or issue of the Consideration, including the Shares in Wildcat and Performance Rights, is conditional upon and will not take effect until GAM obtains the necessary approvals under the Foreign Acquisitions and Takeover Act 1975 (Cth), or confirmation that such approvals are not required.

Completion of the transaction is conditional upon:

#### 17 May 2023

- a) Wildcat successfully completing a capital raising of at least \$5,000,000 and holding a minimum cash balance of \$10,000,000;
- b) Wildcat obtaining necessary shareholder approvals required by law or the ASX Listing Rules, which includes approval to issue the Consideration Shares, the Success Fee (defined below) and the Introduction Fee (defined below) under Listing Rule 7.1 in relation to the Consideration Shares and the Success Fee, Listing Rule 10.11 and section 208 of the Corporations Act (if required) in relation to the Introduction Fee, and approval under item 7 of section 611 of the Corporations Act (if required);
- c) Ministerial consent under the Mining Act (if required) to transfer the Tabba Tabba Tenements and to the registration of the Royalty Security following the transfer;
- d) RCF consenting to Wildcat as a transferee of the Tabba Tabba Tenements in accordance with the RCF Royalty;
- e) RCF and GAM making certain amendments to the RCF Royalty and agreeing the form of the Royalty Security, in each case in a form acceptable to, RCF, GAM and Wildcat; and
- f) Execution of a deed of assumption, assignment and release and deed of covenant in relation to the RCF Royalty (as amended), execution of each Royalty Security and execution of a priority deed, in each case in a form acceptable by all parties to them.

### **Appointment of Nominee Director**

GAM will have a right to appoint a Nominee Director subject to GAM (and its associates) holding a relevant interest in Shares representing at least 10% of all Shares on issue.

### Success Fee and Introductory Fee

Subject to Wildcat obtaining Shareholder approval, Wildcat has agreed to issue the following securities to Mr Alex Hewlett (non-executive director), or his nominee, upon completion of the transaction as an introduction fee ("Introduction Fee"):

- a. 10,000,000 options each exercisable into one Share at a zero-cent exercise price on or before 48 months from issue, subject to a vesting condition that WC8 obtains Ministerial consent under the Mining Act (if required) to transfer the Tabba Tabba Tenements;
- b. 6,666,666 options each exercisable into one Share at a zero-cent exercise price on or before 48 months from issue, subject to vesting conditions that: (1) WC8 obtains Ministerial consent under the Mining Act (if required) to transfer the Tabba Tabba Tenements; and (2) Wildcat's Share price exceeds a 30-day VWAP of A\$0.042 per Share;
- c. 6,666,667 options each exercisable into one Share at a zero-cent exercise price on or before 48 months from issue, subject to vesting conditions that: (1) WC8 obtains Ministerial consent under the Mining Act (if required) to transfer the Tabba Tabba Tenements; and Wildcat's Share price exceeds a 30-day VWAP of A\$0.056 per Share; and
- d. 6,666,667 options each exercisable into one Share at a zero-cent exercise price on or before 48 months from issue, subject to vesting conditions that: (1) WC8 obtains Ministerial consent under the Mining Act (if required) to transfer the Tabba Tabba Tenements; and (2) Wildcat's Share price exceeds a 30-day VWAP of A\$0.07 per Share
- b) Harvis Advisers Pty Ltd (**Harvis**) have been engaged as Wildcat's advisors in respect to the transaction. Upon completion of the transaction, Wildcat will issue Harvis a success fee of ("Success Fee"):
  - a. 10,000,000 Shares;
  - b. 10,000,000 options each exercisable into one Share at an exercise price of A\$0.040 on or before 36 months from issue subject to a vesting condition that the 30-day VWAP of Wildcat Shares exceeds A\$0.042 per Share;

#### 17 May 2023

- c. 10,000,000 options each exercisable into one Share at an exercise price of A\$0.045 on or before 36 months from issue subject to a vesting condition that the 30-day VWAP of Wildcat Shares exceeds A\$0.056 per Share; and
- d. 10,000,000 options each exercisable into one Share at an exercise price of A\$0.06 on or before 48 months from issue subject to a vesting condition that the 30-day VWAP of Wildcat Shares exceeds A\$0.07 per Share.

### Capital Raising and Use of funds

WC8 has firm bids for a capital raising of 200,000,000 Shares at an issue price of 3.5 cents per Share to raise up to \$7,000,000 before costs ("Capital Raising"). The issue of shares in connection with the Capital Raising will, consistent with the issue of the Consideration Shares the Success Fee, and the Introduction Fee, be subject to Wildcat obtaining shareholder approval under Listing Rule 7.1. The directors of Wildcat (and / or their related parties) have, subject to Wildcat obtaining shareholder approval, subscribed for \$750,000 in placement.

Wildcat has engaged advisors and brokers in respect of the Capital Raising and expects to pay fees of up to 5% of the amount raised under the Capital Raising, being a maximum of \$350,000 based on full subscription.

As at the end of March 2023, WC8 had approximately \$4.9m cash on hand. Upon receipt of funds, WC8 will have in excess of \$10,000,000 cash on hand on a fully subscribed basis.

Wildcat has obtained POW approval from DMIRS for 1,000 RC drill holes and 1,000 diamond drill holes and intends to drill an initial 6,000m of mixed RC and diamond drilling to define the lithium mineralised footprint of the Tabba Tabba pegmatite field. It will then commence infill drilling and work towards resource definition.

The Company is obliged to spend at least \$1m in ground in the first year of owning the project. Additionally, the Company will complete aircore drilling at Bolt Cutter and continue soil sampling to work up additional targets for initial aircore drilling. At Mt Adrah in NSW, the Company expects to drill approximately 5,000m of mixed RC and diamond drilling and continue its regional reconnaissance soil sampling and geophysics programs.

#### Indicative timetable for the Transaction and Capital Raise

ve illiterable for the transaction and Capital Raise	
Event	Timing
Announcement of Transaction and Capital Raise	17 May 2023
Release Notice of Meeting to ASX	29 May 2023
Extraordinary General Meeting (EGM) to be held to approve the	26 June 2023
Transaction and the Capital Raise	
Settlement in connection with the Capital Raise	3 July 2023
FIRB Approval obtained	21 July 2023
Completion of Acquisition and issue of Consideration Shares,	28 July 2023
Success Fee and Introductory Fee	

The above dates are indicative only and are subject to change. The Company reserves the right to amend this indicative timetable at any time without prior notice.

#### Proposed Changes to Wildcat's Capital Structure

The table below shows the effect that the transaction and Capital Raising will have on Wildcat's capital structure:

Shares	Number
Shares currently on issue	662,022,727
Shares to be issued under the Capital Raising	200,000,000

Shares on issue after the Capital Raising	862,022,727
Shares to be issued under the Proposed Transaction	186,660,512
Shares to be issued under the Success Fee	10,000,000
Shares on issue after the Proposed Transaction	1,058,683,239
Options	Number
Options currently on issue	41,000,000
Options to be issued under the Success Fee	30,000,000
Options to be issued under the Introduction Fee	30,000,000
Options on issue after the Proposed Transaction	101,000,000
Performance Rights	Number
Performance Rights currently on issue	134,000,000
Performance Rights to be issued under the Proposed Transaction	62,220,171
Performance Rights on issue after the Proposed Transaction	196,220,171

### Tabba Tabba Resource

A 2012 JORC compliant tantalum mineral resource for the Tabba Tabba Project was announced by Pilbara Minerals in January 2015<sup>6</sup>. Wildcat Intends to re-estimate the tantalum resource should a maiden lithium resource be defined and announce both the tantalum and lithium resources. This is anticipated in 2024 to 2025. The combined measured, indicated and inferred resource currently stands at 318.1Kt at 950ppm  $Ta_2O_5$  for 666,200lbs of contained  $Ta_2O_5$  at a 400ppm  $Ta_2O_5$  lower cut off grade and 6,000ppm  $Ta_2O_5$  upper cut off grade. This uses a database of 154 drill holes and a geological model developed by Pilbara Minerals Ltd constrained by geological logging and assay data for  $Ta_2O_5$ . The resource calculation was carried out by an independent resource consultancy, Trepanier pty ltd. The resultant Measured, Indicated and Inferred Mineral Resource estimate is:

Measured	35.1kT @ 1,380ppm Ta <sub>2</sub> O <sub>5</sub>	107,125 lb Ta <sub>2</sub> O <sub>5</sub>
Indicated	187.0kT @ 1,020ppm Ta <sub>2</sub> O <sub>5</sub>	418,925 lb Ta <sub>2</sub> O <sub>5</sub>
Inferred	96.0kT @ 660ppm Ta <sub>2</sub> O <sub>5</sub>	140,150 lb Ta <sub>2</sub> O <sub>5</sub>
Combined	318.1Kt @ 950ppm Ta <sub>2</sub> O₅	666,200 lb Ta <sub>2</sub> O <sub>5</sub>

### Summary of resource estimate and reporting criteria

As per ASX Listing Rule 5.8 and the 2012 JORC reporting guidelines, a summary of the material information used to estimate the Mineral Resource is detailed below (for more detail please refer to Table 1, Table 3, and Sections 1 to 3 included below following Appendix 1).

#### Geology and geological interpretation

The Tabba Tabba pegmatites are part of the later stages of intrusion of Archaean granitic batholiths into Archaean metagabbros and metavolcanics. Tantalum mineralisation occurs in zoned pegmatites that intruded a sheared Archaean metagabbro. The pegmatite contains in outcrop a symmetrically disposed outer cleavlandite zone, mica zone and a megacrystic K feldspar zone with a centrally disposed quartz zone associated with an albitic replacement unit. The zones generally dip in sympathy with pegmatite margins. The Main Tabba Tabba pegmatite is a thick (frequently greater than 20m) funnel-shaped dyke which strikes northwest and dips 30°-40° NE. It can be followed in outcrop along strike for at least 400m and historical drilling has intercepted it up to 80 m down dip. The pegmatite is thickest at surface, thinning and bifurcating at depth, and is mineralogically zoned. Three distinct Quartz Cores have been recognised, and tantalum mineralization is mainly restricted to the Albite replacement and Lithium alteration zones and is composed of tantalite, wodginite and

<sup>&</sup>lt;sup>6</sup> Pilbara Minerals Ltd ASX announcement 19<sup>th</sup> January 2015: <a href="https://cdn-api.markitdigital.com/apiman-gateway/ASX/asx-research/1.0/file/2995-01591791-6A706666?access">https://cdn-api.markitdigital.com/apiman-gateway/ASX/asx-research/1.0/file/2995-01591791-6A706666?access</a> token=83ff96335c2d45a094df02a206a39ff4

#### 17 May 2023

(in the Lithium alteration zone) microlite. Three distinct mineralized zones occur as sheets which average 2m to 3m in thickness, but may be up to 6 m thick, which strike and dip in sympathy with the pegmatite margins.

### Drilling techniques and hole spacing

The deposit was sampled using a series of Airtrac open hole percussion ("OHP"), reverse circulation ("RC") and PQ diamond drill holes ("DD"). Goldrim Mining Ltd and Pancontinental Mining Ltd ("PanCon") completed 24 OHP, 60 RC and 3 DD holes between 1984 and 1991. Five OPH holes drilled in 1984 were sited outside of the resource area and therefore have not been used in this estimate. Global Advanced Metals ("GAM") completed 29 infill and extensional RC holes in March 2013. Pilbara Minerals ("PLS") completed 4 infill and 1 extensional DD holes in November 2013 and a further 38 RC holes (1,386m) in September/October 2014. Sections are generally spaced 10m to 20m (Local Northing), while holes on section were spaced 5m to 20m apart (see Figures 2 and 3 above). Sampling and sub-sampling techniques Sample information used in resource estimation was derived primarily from RC drilling with limited diamond core drilling. The drill samples have been geologically logged and sub-sampled for lab analysis.

#### Sample analysis method

Historical assays were analysed by SGS Laboratories using low dilution fusion XRF. The GAM samples were assayed by GAM's Wodgina Site Laboratory for a 36 element suite using XRF on fused beads. Nagrom checks were undertaken using ICP and included Li together with Ta 2 O5 , Nb<sub>2</sub>O<sub>5</sub> and Sn. The recent PLS holes were sampled and analysed by Nagrom by both fused bead XRF and ICP. No geophysical tools were used to determine any element concentrations used in the resource estimate.

#### **Cut-off grades**

Grade envelopes have been wireframed to a 0.04% Ta 2 O5 cut-off with allowance for geological continuity of the higher-grade zone. Mining, metallurgical and economic parameters were considered for determining the cut-off grade used for reporting. The 0.04%  $Ta_2O_5$  cut-off grade used is based on the application of a simple economic model (in AUD\$ -  $Ta_2O_5$  price of \$80/lb, open-cut mine operating costs of \$3.33/t, processing costs of \$44.50/t ore based on annualised mining and processing of 93,600 tonnes ore, with 82%  $Ta_2O_5$  processing recovery). Based on visual and statistical analysis of the drilling results and geological logging of the pegmatite zoning, this cut-off tends to be exactly the same or very close to the natural geological cleavelandite zone in the pegmatite.

#### **Estimation Methodology**

Grade estimation was by Ordinary Kriging ("OK") for  $Ta_2O_5$  using GEOVIA Surpac<sup>TM</sup> software. The estimate was resolved into 5m (E) x 5m (N) x 2.5m (RL) parent cells that had been sub-celled at the domain boundaries for accurate domain volume representation. Estimation parameters were based on the variogram models, data geometry and kriging estimation statistics. Based on statistical analysis of the data population, an upper cut (top-cut) grade of 6,000ppm  $Ta_2O_5$  was applied prior to estimation.

### Classification criteria

The Tabba Tabba Mineral Resource has been classified as a combination of Measured, Indicated and Inferred according to JORC 2012. Reclassification from the resource published in December 2013 was facilitated by the drilling of 38 RC holes targeting along strike and down-dip positions, and considering the drill spacing of 10m to 20m (Local Northing), and 5m to 20m on section, has allowed the re-classification of significant portions of the previous Inferred resource to Indicated. Drill spacing for Measured is generally 10m (Local Northing) by 5 to 10m (Local Easting) and Indicated is 20m (Local Northing) by 15 to 20m (Local Easting). The fringes of the resource, with typical drill spacing of 40m (Local Northing) by 20m (Local Easting), remain in the Inferred category.

### Mining and metallurgical methods and parameters

The expected mining method is open pit mining with 15% dilution allowed in pit optimization work. A combination of historical plus more recent metallurgical testwork by Nagrom indicates that the assumption for potential successful processing of Tabba Tabba ore is reasonable.

#### - ENDS -

This announcement has been authorised by the Board of Directors of the Company.

### **Forward-Looking Statements**

This document may include forward-looking statements. Forward-looking statements include, but are not limited to, statements concerning Wildcat Resources Limited's planned exploration programme and other statements that are not historical facts. When used in this document, the words such as "could," "plan," "estimate," "expect," "intend," "may", "potential," "should," and similar expressions are forward-looking statements. Although Wildcat Resources Limited believes that its expectations reflected in these forward-looking statements are reasonable, such statements involve risks and uncertainties and no assurance can be given that actual results will be consistent with these forward-looking statements.

### **Competent Person's Statement**

The information in this announcement that relates to Exploration Results for Tabba Tabba Project is based on, and fairly represents, information compiled by Mr Samuel Ekins, a Competent Person who is a Member of the Australian Institute of Mining and Metallurgy (AusIMM). Mr Ekins is a fulltime employee of Wildcat Resources Limited. Mr Ekins has sufficient experience that is relevant to the style of mineralisation and type of deposit under consideration, and to the activity being undertaken to qualify as a Competent Person as defined in the 2012 Edition of the JORC Code. Mr Ekins consents to the inclusion in the report of the matters based on his information in the form and context in which it appears.

The information in this announcement that relates to the Tabba Tabba Mineral Resources is based on and fairly represents information compiled by Mr Samuel Ekins, a full-time employee of Wildcat Resources Ltd and a member of the Australasian Institute of Mining and Metallurgy. Mr Ekins has sufficient experience of relevance to the styles of mineralisation and types of deposits under consideration, and to the activities undertaken to qualify as Competent Persons as defined in the 2012 Edition of the Joint Ore Reserves Committee (JORC) Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves. Mr Ekins consents to the inclusion in this announcement of the matters based on his information in the form and context in which they appear.

The information in this announcement that relates to the reported tantalum resource for the Tabba Tabba Project is extracted from the report entitled "Pilbara Reports Updated Mineral Resource for Tabba Tabba Tantalum Project, WA created on 19th January 2015 and is available to view on <a href="https://cdn-api.markitdigital.com/apiman-gateway/ASX/asx-research/1.0/file/2995-01591791-6A706666?access token=83ff96335c2d45a094df02a206a39ff4">https://cdn-api.markitdigital.com/apiman-gateway/ASX/asx-research/1.0/file/2995-01591791-6A706666?access token=83ff96335c2d45a094df02a206a39ff4</a>. The Company confirms that it is not aware of any new information or data that materially affects the information included in the original market announcement and, in the case of Code is in normal typeface, guidelines are in indented italics, definitions are in bold. 43 JORC Code, 2012 Edition estimates of Mineral Resources or Ore Reserves, that all material assumptions and technical parameters underpinning the estimates in the relevant market announcement continue to apply and have not materially changed. The Company confirms that the form and context in which the Competent Person's findings are presented have not been materially modified from the original market announcement.

<u>No New Information or Data</u>: This announcement contains references to exploration results, Mineral Resource estimates, Ore Reserve estimates, production targets and forecast financial information

# ASX Announcement 17 May 2023

derived from the production targets, all of which have been cross-referenced to previous market announcements by the relevant Companies. Wildcat confirms that it is not aware of any new information or data that materially affects the information included in the relevant market announcements. In the case of Mineral Resource estimates, Ore Reserve estimates, production targets and forecast financial information derived from the production targets, all material assumptions and technical parameters underpinning the estimates, production targets and forecast financial information derived from the production targets contained in the relevant market announcement continue to apply and have not materially changed in the knowledge of Wildcat.

This document contains exploration results and historic exploration results as originally reported in fuller context in Wildcat Resources Limited ASX Announcements - as published on the Company's website. Wildcat confirms that it is not aware of any new information or data that materially affects the information included in the relevant market announcements. In the case of Mineral Resource estimates, Ore Reserve estimates, production targets and forecast financial information derived from the production targets, all material assumptions and technical parameters underpinning the estimates, production targets and forecast financial information derived from the production targets contained in the relevant market announcement continue to apply and have not materially changed in the knowledge of Wildcat.

- 1. Hole prefixed DDH, TAT or TRC are historic holes drilled by Goldrim Mining Ltd and Pancontinental Mining Ltd between 1984 and 1991. Holes prefixed TTRC were drilled by Global Advanced Metals in March 2013. Holes prefixed GT and MET were drilled by PLS in Oct 2013.
- 2. Holes types are Airtrac open hole percussion ("OHP"), reverse circulation ("RC") and PQ diamond drill holes ("DD").
- 3. All coordinates are reported in projection Map Grid of Australia (MGA) Zone 50, Geodetic Datum of Australia 1994 (GDA94).
- 4. NSI is No Significant Intersection.
- 5. Intercepts with grades below 400ppm Ta<sub>2</sub>O<sub>5</sub> included to allow for geological continuity within the pegmatite

### JORC Code, 2012 Edition – Table 1

### **Section 1 Sampling Techniques and Data**

(Criteria in this section apply to all succeeding sections.)

Criteria	Criteria	Commentary
Sampling techniques	<ul> <li>Nature and quality of sampling (eg cut channels, random chips, or specific specialized industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc). These examples should not be taken as limiting the broad meaning of sampling.</li> <li>Include reference to measures taken to ensure sample representivity and' the appropriate calibration of any measurement tools or systems used.</li> <li>Aspects of the determination of mineralisation that are Material to the Public Report.</li> <li>In cases where 'industry standard' work has been done this would be relatively simple (eg 'reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay'). In other cases more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (eg submarine nodules) may warrant disclosure of detailed information.</li> </ul>	<ul> <li>The deposit was sampled using a series of Airtrac open hole percussion ("OHP"), reverse circulation ("RC") and PQ diamond drill holes ("DD"). Goldrim Mining Ltd and Pancontinental Mining Ltd ("PanCon") completed 24 OHP, 59 RC and 3 DD holes between 1984 and 1991. Five OPH holes drilled in 1984 were sited outside of the resource area and therefore have not been used in this estimate. Sections were spaced 10m to 20m (Local Northing), while holes on section were spaced 5m to 20m apart. Global Advanced Metals ("GAM") completed 29 infill and extensional RC holes in early 2013 (including the TDR series holes with lithium assays listed in Appendix 1, Table 2). Pilbara Minerals Limited ("PLS") completed 5 infill and extensional RC holes in September 2014.</li> <li>Sampling of RC drill holes was completed on 1m intervals.</li> <li>With the exception of one historical report noting that samples were split at the rig, there is little information relating to the specific sampling methods used by PanCon.</li> <li>GAM RC holes were sampled every metre, with samples split on the rig using a cyclone splitter.</li> <li>PLS diamond holes were sampled within the pegmatite zone (geological control for contacts) and internally within this zone on a metre interval basis. Samples were comprised of half HQ core cut using a diamond saw.</li> <li>PLS RC holes were sampled every metre witin the pegmatite zone, with samples split on the rig using a cyclone splitter. Samples were a consistent 3-5kg.</li> <li>The majority of PanCon samples were generated using RC drilling. Samples were split on site and sent to the laboratory for analyses by XRF fusion methods.</li> <li>Widths and grades intersected by OHP holes were confirmed by RC drilling.</li> <li>Three diamond holes were drilled which showed good agreement with previous RC holes and confirmed mineralised widths and grades.</li> <li>GAM holes were all RC, with samples split at the rig samples sent to the Wodgina site laboratory.</li> <li>The GAM samples were check assayed indep</li></ul>

		PLS RC samples were check assayed independently by Nagrom. 1 metre duplicates, blanks and Standards were inserted independently by Nagrom. These samples were assayed by both fused bead XRF and ICP
Drilling techniques	Drill type (eg core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (eg core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc).	<ul> <li>A total of 24 OHP, 122 RC, 5 HQ DD and 3 PQ DD holes have been completed with depths between 10m and 81m.</li> <li>For the historic DD holes, only one was drilled at 600. It is unknown whether the core was oriented and whether standard tubes or triple tubes were used.</li> <li>4 of the 5 recent PLS DD holes were drill at 600 and one at 500. For all 5 holes, the</li> </ul>
		<ul> <li>core was oriented using a Reflex ACT digital core orientation instrument.</li> <li>Reverse circulation drilling of the 2013 drill holes and the September 2014 holes was undertaken using a track mounted Schramm 450 drill rig with booster compressor, using face sampling 5 ½ inch bit.</li> </ul>
Drill sample recovery	<ul> <li>Method of recording and assessing core and chip sample recoveries and results assessed.</li> <li>Measures taken to maximise sample recovery and ensure representative nature of the samples.</li> <li>Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material.</li> </ul>	<ul> <li>Sample recovery was recorded for GAM and PLS RC holes, with the majority being reported as "good". No information for historical holes has been uncovered.</li> <li>Core recovery for the 5 PLS DD holes was excellent</li> <li>Whilst drilling through the pegmatite, rods were flushed with air after each metre drilled (GAM and PLS RC holes).</li> <li>No information is available for previous drilling.</li> <li>For the 5 PLS DD holes, core recovery was excellent and half (HQ sized) core was submitted for analysis.</li> <li>Recoveries for the majority of the historical holes are not known, while recoveries for GAM and PLS RC holes were overwhelmingly logged as "good." Whilst weights of all GAM bulk residues were not available, weights of the mineralized zones' bulk residue samples sent from GAM to Nagrom (for metallurgical testwork) were recorded. These weights were compared to the expected sample weight for 5.5 inch diameter RC holes using a bulk density of 2.6 (see bulk density section below) and recoveries were deemed acceptable.</li> </ul>
Logging	<ul> <li>Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies.</li> <li>Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc) photography.</li> <li>The total length and percentage of the relevant intersections logged.</li> </ul>	<ul> <li>Detailed lithological logs exist for all holes in the database. Fields captured include lithology, alteration, texture, recovery (GAM and PLS holes only), weathering and colour.</li> <li>Detailed specialist geotechnical logging has been completed on the 5 PLS DD holes</li> <li>Logging has primarily been quantitative.</li> <li>Core photos are available for the 5 PLS DD holes.</li> <li>The database contains lithological data for all holes in the database</li> </ul>
Sub-sampling techniques and sample preparation	<ul> <li>If core, whether cut or sawn and whether quarter, half or all core taken.</li> <li>If non-core, whether riffled, tube sampled, rotary split, etc and whether sampled wet or dry.</li> <li>For all sample types, the nature, quality and appropriateness of the sample preparation technique.</li> </ul>	<ul> <li>It is not known which sampling techniques were employed for OHP holes.</li> <li>While a historical report mentions that RC samples were split, no further information is available on sampling techniques employed by PanCon.</li> <li>It is unknown what size core fraction was submitted for geochemical analysis. Core was primarily used for historical metallurgical test work.</li> </ul>

### 17 May 2023

•	Quality control procedures adopted for all sub-sampling stages to maximise
	representivity of samples.

- Measures taken to ensure that the sampling is representative of the in-situ material collected, including for instance results for field duplicate/second-half sampling.
- Whether sample sizes are appropriate to the grain size of the material being sampled.
- RC samples collected by GAM and PLS were generally dry and split at the rig using a cyclone splitter.
- Laboratory samples for the PLS RC holes were sorted, dried, crushed to 6.3mm, samples in excess of 2kg were riffle split and then pulversied to 80% passing -75um.
- The 5 PLS DD holes were cut using a diamond saw and half core (HQ size) submitted for analysis
- Laboratory standards were used by the lab at a rate of approximately one sample per 100 assays and blanks and assay repeats were completed at a rate of approximately one per 100 assays. No major issues were encountered with the quality control sampling.
- Historical samples have some repeat assays (some 32 samples or about 4 % of these data). It was found that 80% of these repeats were within 15% tolerances.
- GAM samples have field duplicates as well as laboratory splits and repeats.
- PLS DD and RC samples have regular coarse crush duplicates as well as laboratory splits and repeats.
- Historical samples have some repeat assays for approximately 4% of the data. The nature of these QC samples (i.e. whether field duplicate or laboratory repeat) is unknown.
- For the GAM drilling, field duplicates were taken approximately every 20m, and splits were undertaken at the sample prep stage on every other 20m.
- GAM and PLS RC samples have field duplicates as well as laboratory splits and repeats.
- PLS DD samples have regular coarse crush duplicates
- The GAM and PLS drilling sample sizes are considered to be appropriate to correctly represent the tantalum mineralization at Tabba Tabba based on the style of mineralization (pegmatite) and the thickness and consistency of mineralization

#### Quality of assay data and laboratory tests

- The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total.
- For geophysical tools, spectrometers, handheld XRF instruments, etc, the
  parameters used in determining the analysis including instrument make and
  model, reading times, calibrations factors applied and their derivation, etc.
- Nature of quality control procedures adopted (eg standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (ie lack of bias) and precision have been established.

- Historical assays were analysed by SGS using low dilution fusion XRF.
- The GAM samples were assayed by the Wodgina Laboratory, for a 36 element suite using XRF on fused beads.
- Nagrom checks were undertaken using ICP and included Li together with Ta $_2O_5$ , Nb $_2O_5$  and Sn .
- Historical samples have some repeat assays for approximately 4% of the data. The nature of these QC samples (i.e. whether field duplicate or laboratory repeat) is unknown.
- For the GAM drilling, field duplicates were taken approximately every 20m, and splits were undertaken at the sample prep stage on every other 20m.
- GAM and PLS RC samples have field duplicates as well as laboratory splits and repeats.
- The PLS core samples were assayed by Nagrom, for a 36 element suite using XRF on fused beads with checks using ICP

17 Ividy 2025		•	PLS RC samples were analysed by Nagrom using their standard tin suite by XRF
		•	analysis and mixed acid digest with ICP finish.  Assays from hard copy logs of historical drilling shows some laboratory checks were undertaken, although the specific repeat type (e.g. field duplicate vs. laboratory split) is not described.
		•	The GAM drilling contains QC samples (field duplicates and laboratory pulp splits, GAM internal standard).
		•	GAM pulps were independently analysed by Nagrom metallurgical consultants and confirmed results obtained by the Wodgina laboratory. The Nagrom Laboratory is ISO9001 accredited by Bureau Veritas.
		•	The PLS sample batches contain QC samples (coarse crush duplicates and laboratory pulp splits, blanks and two different Certified Reference Materials – both lower and upper range).
		•	All results from QC samples have produced results deemed acceptable.
Verification of sampling and	The verification of significant intersections by either independent or alternative company personnel.	•	OHP hole TAT006 was twinned by RC hole TRC005 with a separation of 2m. Grades and widths were comparable, but somewhat biased towards the RC hole.
assaying	<ul> <li>The use of twinned holes.</li> <li>Documentation of primary data, data entry procedures, data verification, data</li> </ul>	•	Limited infill drilling completed by GAM in 2013 confirmed the approximate width and grade of historical drilling.
	storage (physical and electronic) protocols.  • Discuss any adjustment to assay data.	•	The assay results for the 5 PLS drill-holes generally were consistent with the interpreted model, although the assay results from MET holes 2 and 3 were lower than expected.
		•	The assay results for the 38 PLS RC holes are generally consisted with the interpreted model Location of sample sites of rock chip sampling program recorded by hand-held GPS.
		•	All current data is in MGA94 (Zone 51).
		•	The area is generally flat and sample elevation has not been estimated.
		•	An electronic database containing collars, surveys, assays and geology was provided by GAM. Data verification was undertaken by checking all 700 historical assays and collars against hard copy logs.
		•	All GAM assays were sourced directly from Wodgina internal laboratory files.
		•	Nagrom checks (GAM holes) and results (PLS holes) were supplied by certified PDF and Excel spreadsheet.
		•	Historical reports listed primarily Ta ppm. Ta was converted to $Ta_2O_5$ for the purpose of the resource estimation. The conversion used was $Ta_2O_5 = Ta \times 1.2211$
Location of data points	Accuracy and quality of surveys used to locate drill holes (collar and downhole surveys), trenches, mine workings and other locations used in Mineral Resource estimation.	•	Historical drill holes were located on a local grid that was established by previous operators. Local grid coordinates in the database were verified against hard copy logs. A small number of data entry errors were corrected.
	<ul> <li>Specification of the grid system used.</li> <li>Quality and adequacy of topographic control.</li> </ul>	•	GAM holes were surveyed using DGPS. Local grid coordinates were calculated using the re-calculated grid conversion.
	- Quality and adoquately of topographile control.		

.7 IVIAY 2023		
		John Young (Pilbara Minerals) successfully verified the location of 2 historical and 16 GAM holes in a field visit conducted in September 2013. All holes were found to be within handheld GPS error (the majority are less than 2.5m).
		The database supplied by GAM only contained planned surveys for the majority of historical holes. Due to the shallow termination depths (average 27m), the lack of downhole surveys are not deemed material.
		Planned and downhole surveys were supplied for GAM holes. The average depth of GAM holes was 39m. Planned and downhole surveys show satisfactory correlation.
		PLS holes have been surveyed by handheld GPS and checked by measurement against GAM hole collars.
		The resource was calculated using a local grid originally established by previous operators. The grid conversion was calculated using local coordinates and corresponding MGA (GDA94, Zone 50) coordinates provided by GAM. Local coordinates were calculated for GAM and PLS holes.
		The topographic surface used was supplied by GAM and was generated by Wodgina mine surveyors.
Data spacing and	<ul> <li>Data spacing for reporting of Exploration Results.</li> <li>Whether the data spacing and distribution is sufficient to establish the degree</li> </ul>	Historical holes were completed on 10 to 20m sections (Local Northing), while holes on section were spaced 5m to 20m apart.
distribution	of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied.  • Whether sample compositing has been applied.	GAM completed 29 infill and extensional RC holes in March 2013.
		PLS completed 4 infill and 1 extensional DD holes in October 2013.
		PLS Completed 38 infill and extensional holes in September 2014
		The interpretation of the mineralised domains are supported by a tight drill spacing, plus both geological zones and assay grades, and are appropriate for use in a resource estimation procedure
		99.4% of OHP and RC holes were sampled at 1m intervals.
		The majority of DD holes were sampled at intervals between 0.3m and 1m. A small number of composites in excess of 1m were collected near surface where holes were being established.
		RC holes were sampled at 1m intervals.
		For the purpose of resource estimation all samples were composited to 1m with a minimum sample length of 0.5m
Orientation of data in relation to geological structure	<ul> <li>Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type.</li> <li>If the relationship between the drilling orientation and the orientation of key</li> </ul>	102 out of 154 holes are drilled vertically (66%). The majority of the remaining holes are drilled at 60° with azimuths of between 320° and 325° and 225° and 235°., and
		one with an azimuth of 0500.
	mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material.	<ul> <li>The mineralisation dips approximately 35 degrees at a dip direction of 50 degrees (90 degrees Local Grid).</li> </ul>
		The drilling orientation and the intersection angles are deemed appropriate
		No orientation-based sampling bias has been identified

17 May 2023		RESOURCES
Sample	The measures taken to ensure sample security.	Historical sampling security measures (if any) are unknown.
security		<ul> <li>Chain of custody for GAM holes were managed by GAM personnel. Samples were delivered to the Wodgina laboratory by GAM personnel where samples were analysed.</li> </ul>
		Chain of custody for PLS holes were managed by PLS personnel. Samples were delivered to the Nagrom laboratory by PLS personnel where samples were analysed.
Audits or	The results of any audits or reviews of sampling techniques and data.	Sampling techniques for historical assays have not been audited.
reviews		The collar and assay data have been reviewed by checking all of the data in the supplied digital database against hard copy logs.
		All GAM assays were sourced directly from the laboratory (Wodgina laboratory).
		All Nagrom Assays were sourced directly from Nagrom as certified PDF and Excel files.

# WILDCAT

### **Section 2 Reporting of Exploration Results**

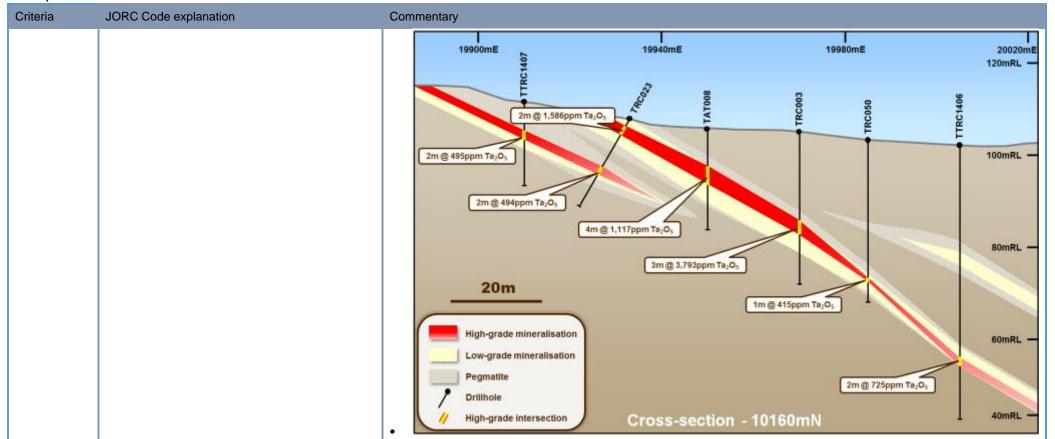

(Criteria listed in the preceding section also apply to this section.)

Criteria	JORC Code explanation	Commentary
Mineral tenement and land tenure status	<ul> <li>Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings.</li> <li>The security of the tenure held at the time of reporting along with any known impediments to obtaining a licence to operate in the area.</li> </ul>	<ul> <li>GAM owns 100% of the Mining Leases (M45/354; M45/375; M45/376 and M45/377)</li> <li>An agreement is in place between GAM and Nagrom for mining and offtake.</li> <li>PLS have purchased 50% of the Nagrom Mining Ltd.</li> <li>No known impediments.</li> </ul>
Exploration done by other parties	Acknowledgment and appraisal of exploration by other parties.	<ul> <li>Goldrim Mining Ltd and Pancontinental Mining Ltd ("PanCon") completed 24 OHP, 59 RC and 3 DD holes between 1984 and 1991.</li> <li>Gam drilling of 29 RC holes in 2013.</li> <li>PLS completed 5 diamond holes in November 2013.</li> </ul>
Geology	Deposit type, geological setting and style of mineralisation.	The Tabba Tabba pegmatites are part of the later stages of intrusion of Archaean granitic batholiths into Archaean metagabbros and metavolcanics. Tantalum mineralisation occurs in zoned pegmatites that intruded a sheared Archaean metagabbro. The pegmatite contains in outcrop a symmetrically disposed outer cleavlandite zone, mica zone and a megacrystic K feldspar zone with a centrally disposed quartz zone associated with an albitic replacement unit. The zones generally dip in sympathy with pegmatite margins. (Sourced from PanCon historical reports).
Drill hole information	A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drill holes:	Refer to Appendix 1 of this announcement, specifically table 2 and table 3.

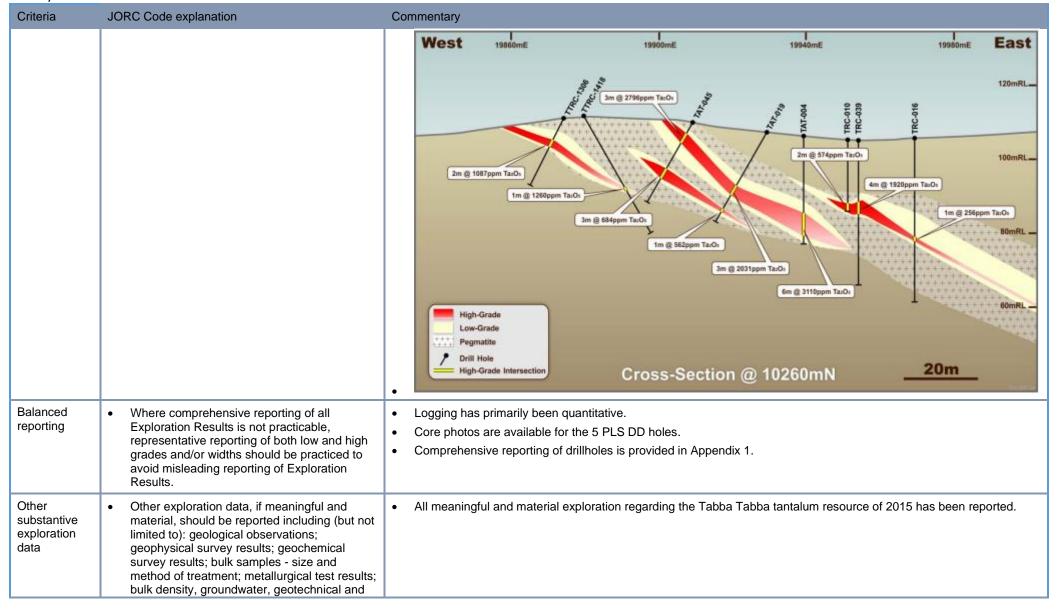

Criteria	JORC Code explanation	Commentary
	from the understanding of the report, the Competent Person should clearly explain why this is the case.	
Data aggregation methods	<ul> <li>In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (eg cutting of high grades) and cut-off grades are usually Material and should be stated.</li> <li>Where aggregate intercepts incorporate short lengths of high-grade results and longer lengths of low-grade results, the procedure used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail.</li> <li>The assumptions used for any reporting of metal equivalent values should be clearly stated.</li> </ul>	<ul> <li>Length weighted averages used for exploration results reported in Section 3. Cutting of high grades was not applied in the reporting of intercepts in Section 3. In the estimation of the resource, an upper cut (top cut) grade of 6,000ppm Ta<sub>2</sub>O<sub>5</sub> was used.</li> <li>Length weighted averages are reported for exploration drill holes listed in Appendix 1, table 2 with a cut off grade of 0.2% Li<sub>2</sub>O and no more than 1m of internal dilution.</li> <li>Sample recovery was recorded for GAM and PLS RC holes, with the majority being reported as "good". No information for historical holes has been uncovered.</li> <li>Core recovery for the 5 PLS DD holes was excellent.</li> <li>A lower cut off of 400ppm Ta<sub>2</sub>O<sub>5</sub> was used.</li> <li>An upper cut off of 6,000ppm Ta<sub>2</sub>O<sub>5</sub> was used.</li> <li>No metal equivalent values are used.</li> </ul>
Relationship between mineralization widths and intercept lengths	<ul> <li>These relationships are particularly important in the reporting of Exploration Results.</li> <li>If the geometry of the mineralisation with respect to the drill hole angle is known, its nature should be reported.</li> <li>If it is not known and only the down hole lengths are reported, there should be a clear statement to this effect (eg 'down hole length, true width not known').</li> </ul>	Downhole lengths are reported in Section 3 reported within the wireframed 400ppm cut off Ta <sub>2</sub> O <sub>5</sub> zone. Note that some lower grade zones are included for purposes of geological continuity within the pegmatite.
Diagrams	Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported These should include, but not be limited to a plan view of drill hole collar locations and appropriate sectional views.	See this announcement, Figure 2.

### 17 May 2023

Criteria	JORC Code explanation	Commentary
	rock characteristics; potential deleterious or contaminating substances.	
Further work	The nature and scale of planned further work (eg tests for lateral extensions or depth extensions or large-scale step-out drilling).	An initial campaign of 6,000m of RC drilling to confirm the nature, orientation and extent of lithium mineralisation throughout the Tabba Tabba pegmatite field.
	Diagrams clearly highlighting the areas of possible extensions, including the main geological interpretations and future drilling areas, provided this information is not commercially sensitive.	

### **Section 3 Estimation and Reporting of Mineral Resources**

(Criteria listed in the preceding section also apply to this section.)

Criteria	JORC Code explanation	Commentary
Database integrity	Measures taken to ensure that data has not been corrupted by, for example, transcription or keying errors, between its initial collection and its use for Mineral Resource estimation purposes.	The original database was maintained by GAM using AcQuire database software.  Drilling data was exported and supplied as csv files and compiled into a Microsoft Access Database.
	Data validation procedures used.	The database has then been imported into DataShed™ (industry standard drillhole database management software).
		All new has been imported directly into DataShed™.
		Normal data validation checks were completed once the Access database was compiled.
		Historical data was checked against original hard copies sourced directly
		from the Dept. of Mines and Petroleum WAMEX reporting system.
Site visits	Comment on any site visits undertaken by the Competent Person and the outcome of those visits.	John Young (Executive and Chief Geologist - Pilbara Minerals and Competent Person) completed two site visits – one on 16th September 2013 and a second over two days during diamond core drilling in November 2013. During the site visit the deposit area was inspected and the locations of GAM drilling and a limited number of historical holes were verified. Limited surface excavation was also noted. This is accounted for in the current surface DEM. Samuel Ekins, Torrin Rowe, Matthew Banke, Alex Hewlette and Jeff Elliott undertook DD, mapping and sampling on 5 <sup>th</sup> of December 2022.

Criteria	JORC Code explanation	Commentary
Geological interpretation	<ul> <li>Confidence in (or conversely, the uncertainty of) the geological interpretation of the mineral deposit.</li> <li>Nature of the data used and of any assumptions made.</li> <li>The effect, if any, of alternative interpretations on Mineral Resource Estimation.</li> <li>The use of geology in guiding and controlling Mineral Resource estimation.</li> <li>The factors affecting continuity both of grade and geology</li> </ul>	<ul> <li>The confidence in the geological interpretation is considered robust. Tantalum is hosted within a zoned pegmatite hosted by a sheared Archaean metagabbro. Tantalum mineralization is mainly restricted to the Albite replacement and Lithium alteration zones that can be traced both along the dip and strike of the pegmatite.</li> <li>The geological interpretation is supported by drill hole logging and mineralogical studies completed in 1991 by PanCon.</li> <li>No alternative interpretations have been considered at this stage.</li> <li>Grade wireframes correlate well with the logged Albite replacement and Lithium alteration zones.</li> <li>The key factor affecting continuity is the presence of pegmatite.</li> </ul>
Dimensions	The extent and variability of the Mineral Resource expressed as length (along strike or otherwise), plan width, and depth below surface to the upper and lower limits of the Mineral Resource	The main mineralised zone has dimensions of 470m (local grid north-south) averaging 75m down-dip (local Grid east-west) and ranging between 50m and 120m RL
Estimation and modelling techniques	<ul> <li>The nature and appropriateness of the estimation technique(s) applied and key assumptions, including treatment of extreme grade values, domaining, interpolation parameters and maximum distance of extrapolation from data points. If a computer assisted estimation method was chosen include a description of computer software and parameters used.</li> <li>The availability of check estimates, previous estimates and/or mine production records and whether the Mineral Resource estimate takes appropriate account of such data.</li> <li>The assumptions made regarding recovery of by-products.</li> <li>Estimation of deleterious elements or other non-grade variables of economic significance (eg sulphur for acid mine drainage characterisation).</li> <li>In the case of block model interpolation, the block size in relation to the average sample spacing and the search employed.</li> <li>Any assumptions behind modelling of selective mining units.</li> <li>Any assumptions about correlation between variables.</li> <li>Description of how the geological interpretation was used to control the resource estimates.</li> <li>Discussion of basis for using or not using grade cutting or capping.</li> <li>The process of validation, the checking process used, the comparison of model data to drill hole data, and use of reconciliation data if available.</li> </ul>	<ul> <li>Grade estimation using Ordinary Kriging (OK) was completed using Gemcom Surpac™ software.</li> <li>Drill spacing typically ranges from 10m to 40m.</li> <li>Drillhole samples were flagged with wireframed domain codes. Sample data was composited for Ta<sub>2</sub>O<sub>5</sub> to 1m using a best fit method. The very minor number of residuals were considered immaterial and were excluded.</li> <li>Influences of extreme sample distribution outliers were reduced by top- cutting on a domain basis. Top-cuts were decided by using a combination of methods including grade histograms, log probability plots and statistical tools. Based on this statistical analysis of the data population, an upper cut (top-cut) grade of 5,500ppm Ta<sub>2</sub>O<sub>5</sub> was applied prior to estimation.</li> <li>Directional variograms were modelled by domain using traditional variograms. Nugget values are moderate and grade ranges generally short (approximately 50-60m). Domains with limited samples used variography of geologically similar, adjacent domains.</li> <li>Limited surface alluvial mining activity is evident and was undertaken before the most recent surface topographic surveying. Hence the surface DEM used in this resource excludes these mined zones.</li> <li>Nb<sub>2</sub>O<sub>5</sub> has also been estimated into the model.</li> <li>Block model was constructed with parent blocks of 5m (E) by 5m (N) by 2.5m (RL) and sub-blocked to 2.5m (E) by 2.5m (N) by 1.25m (RL). All estimation was completed to the parent cell size. Discretisation was set to 5 by 5 by 2 for all domains.</li> </ul>

Criteria	JORC Code explanation	Commentary
		Three estimation passes were used. The first pass had a limit of 15m, the second pass 30m and the third pass searching a large distance to fill and blocks within the wireframed zones. Each pass used a maximum of 12 samples, a minimum of 6 samples and maximum per hole of 4 samples.
		Search ellipse sizes were based primarily on a combination of the variography and the trends of the wireframed mineralized zones. Hard boundaries were applied between all estimation domains.
		Validation of the block model included a volumetric comparison of the resource wireframes to the block model volumes. Validation of the grade estimate included comparison of block model grades to the de-clustered input composite grades plus swath plot comparison by easting, northing and elevation. Visual comparisons of input composite grades vs. block model grades were also completed
Moisture	Whether the tonnages are estimated on a dry basis or with natural	Tonnes have been estimated on a dry basis.
	moisture, and the method of determination of the moisture content	
Cut-off parameters	The basis of the adopted cut-off grade(s) or quality parameters applied	• Grade envelopes have been wireframed to a 350ppm to 400ppm Ta <sub>2</sub> O <sub>5</sub> cut-off allowing for continuity of the higher-grade zone. Based on visual and statistical analysis of the drilling results and geological logging of the pegmatite zone, this cut-off tends to be exactly the same or very close to the natural geological Albite replacement and lithium alteration zones in the pegmatite. To assist with pit optimization work and dilution issues, a lower grade halo zone generally over 150ppm Ta <sub>2</sub> O <sub>5</sub> cut-off is applied. This zone is separated from the higher-grade zone by hard boundaries and is not reported as resource.
Mining factors or assumptions	Assumptions made regarding possible mining methods, minimum mining dimensions and internal (or, if applicable, external) mining dilution. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider potential mining methods, but the assumptions made regarding mining methods and parameters when estimating Mineral Resources may not always be rigorous. Where this is the case, this should be reported with an explanation of the basis of the mining assumptions made	The expected mining method is open pit ining with 15% dilution allowed in pit optimization work.
Metallurgical factors or assumptions	The basis for assumptions or predictions regarding metallurgical amenability. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider potential metallurgical methods, but the assumptions regarding metallurgical treatment processes and parameters made when reporting Mineral Resources may not always be rigorous. Where this is the case, this should be reported with an explanation of the basis of the metallurgical assumptions made.	A combination of historical plus more recent metallurgical testwork by Nagrom indicates that the assumption for potential successful processing of Tabba Tabba ore is reasonable.

Criteria	JORC Code explanation	Commentary
Environmental factors or assumptions	<ul> <li>Assumptions made regarding possible waste and process residue disposal options. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider the potential environmental impacts of the mining and processing operation. While at this stage the determination of potential environmental impacts, particularly for a greenfields project, may not always be well advanced, the status of early consideration of these potential environmental impacts should be reported. Where these aspects have not been considered this should be reported with an explanation of the environmental assumptions made.</li> </ul>	<ul> <li>Waste ore from mining will be located in a proposed waste rock dump (WRD) facility located within 200m northwest of the proposed pit area, sterilisation drilling of the WRD facility is planned.</li> <li>A Tailings Storage Facility (TSF) has been designed by Coffey Mining Based on a proposed tailings infill for a minimum of 200,000 tonnes. Two environmental studies have been completed by K Lindbeck and Associates and concluded no identifiable Flora concerns within the</li> <li>proposed disturbance footprint areas. The Fauna survey identified possibly Quoll,</li> </ul>
Bulk density	Whether assumed or determined. If assumed, the basis for the assumptions. If	Pebble Mound mouse and Mulgara habitats which again due to the footprint do not raise concerns.  Bulk density was previously estimated from measurements carried out by PanCon
	<ul> <li>determined, the method used, whether wet or dry, the frequency of the measurements, the nature, size and representativeness of the samples.</li> <li>The bulk density for bulk material must have been measured by methods that adequately account for void spaces (vugs, porosity, etc), moisture and differences between rock and alteration zones within the deposit.</li> </ul>	drilling on samples obtained from 3 PQ sized diamond cored holes completed in 1991. No specific information is documented in any of the PanCon reports (i.e. procedures, analysis methods or results) other than mention in the mining evaluation section of the report where it is stated that 'the specific gravity estimate has been made recently from values.
	Discuss assumptions for bulk density estimates used in the evaluation process of the different materials.	Five cored holes were drilled in November 2013 to provide for test work to substantiate the bulk density number used. 101 measurements were completed on the new non-porous core with 76 on the mineralisation host (pegmatite) and 25 on waster zones (mafic rock) with SG determinations completed by the hydrostatic weighting (uncoated) method.
		Analysis of the 101 measurements confirmed the previously used 2.6t/m³ result to be slightly conservative. Final bulk density factors applied to the current resource estimate include 2.64 (mineralised pegmatite ore), 2.67 (pegmatite waste) and 3.01 (mafic rock waste).
Classification	<ul> <li>The basis for the classification of the Mineral Resources into varying confidence categories.</li> <li>Whether appropriate account has been taken of all relevant factors (ie relative</li> </ul>	The Mineral Resource has been classified on the basis of confidence in the geological model, continuity of mineralized zones, drilling density, confidence in the underlying database and the available bulk density information.
	confidence in tonnage/grade estimations, reliability of input data, confidence in continuity of geology and metal values, quality, quantity and distribution of the data).	All factors considered, with primary considerations being recent confirmation of bulk density plus drill spacing, Measured and Indicated classification has been possible for a significant portion of the resource.
	Whether the result appropriately reflects the Competent Person's view of the deposit.	Drill spacing for Measured is generally 10m (Local Northing) by 5m to10m (Local Easting) and Indicated is 20m (Local Northing) by 15m to 20m (Local Easting).  The state of the state
		The fringes of the resource, with typical drill spacing of 40m (Local Northing) by 20m (Local Easting), remain in the Inferred category.
Audits or reviews	The results of any audits or reviews of Mineral Resource estimates.	No third-party review has been considered.

Criteria	JORC Code explanation	Commentary
Discussion of Relative accuracy/ confidence	Where appropriate a statement of the relative accuracy and confidence	<ul> <li>The relative accuracy of the Mineral Resource estimate is reflected in the reporting of the Mineral Resource as per the guidelines of the 2012 JORC Code.</li> <li>The statement relates to global estimates of tonnes and grade.</li> </ul>

### Appendix 2: Due diligence results

Table 2: Due diligence sample results

### Table 1 for reporting in accordance with JORC Code

### **Section 1 Sampling Techniques and Data**

(Criteria in this section apply to all succeeding sections.)

Criteria	Criteria	Commentary
Sampling techniques	Nature and quality of sampling (eg cut channels, random chips, or specific specialized industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc). These examples should not be taken as limiting the broad meaning of sampling.	Rock chip samples were collected at the discretion of the field geologist from outcrops of variably weathered rock. Rock chips were submitted to ALS Laboratories, and the entire sample submitted were pulverised. Samples were analysed for gold by low level aqua regia digest of 25g, and a four-acid digest analysis for 48 element multielement suite by ICP-MS method.
	Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used.	
	Aspects of the determination of mineralisation that are Material to the Public Report.	
	In cases where 'industry standard' work has been done this would be relatively simple (eg 'reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay'). In other cases more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (eg submarine nodules) may warrant disclosure of detailed information.	
Drilling techniques	Drill type (eg core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (eg core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc).	Not applicable to sampling program
Drill sample recovery	Method of recording and assessing core and chip sample recoveries and results assessed.	Not applicable to sampling program
	Measures taken to maximise sample recovery and ensure representative nature of the samples.	
	Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material.	
Logging	Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies.	Not applicable to sampling program

	Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc) photography.	
	The total length and percentage of the relevant intersections logged.	
Sub-sampling techniques and sample preparation	<ul> <li>If core, whether cut or sawn and whether quarter, half or all core taken.</li> <li>If non-core, whether riffled, tube sampled, rotary split, etc and whether sampled wet or dry.</li> <li>For all sample types, the nature, quality and appropriateness of the sample</li> </ul>	<ul> <li>Sample preparation by accredited laboratory. High quality and appropriate preparation technique for assay methods in use.</li> <li>Sample sizes are appropriate to the grain size of the material being sampled.</li> </ul>
	<ul> <li>Quality control procedures adopted for all sub-sampling stages to maximise representivity of samples.</li> <li>Measures taken to ensure that the sampling is representative of the in-situ material collected, including for instance results for field duplicate/second-half sampling.</li> <li>Whether sample sizes are appropriate to the grain size of the material being sampled.</li> </ul>	
Quality of assay data and laboratory tests	<ul> <li>The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total.</li> <li>For geophysical tools, spectrometers, handheld XRF instruments, etc, the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc.</li> <li>Nature of quality control procedures adopted (eg standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (ie lack of bias) and precision have been established.</li> </ul>	Laboratory standards were used by the lab at a rate of approximately one sample per 100 assays and blanks and assay repeats were completed at a rate of approximately one per 100 assays. No major issues were encountered with the quality control sampling.
Verification of sampling and assaying	<ul> <li>The verification of significant intersections by either independent or alternative company personnel.</li> <li>The use of twinned holes.</li> <li>Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols.</li> <li>Discuss any adjustment to assay data.</li> </ul>	<ul> <li>Analytical results for the sampling were received by multiple personnel and compiled into a central database. Results from all samples collected have been reported.</li> <li>No adjustments were made to any sampling assay data</li> <li>At this time there are no processes or procedures guiding data collection, collation, verification and storage. Implementation and development of procedures and documentation are currently being planned.</li> <li>There are no adjustments to the assay data. The data are received from the lab and sent unedited to a consultant database administrator.</li> </ul>
Location of data points	<ul> <li>Accuracy and quality of surveys used to locate drill holes (collar and downhole surveys), trenches, mine workings and other locations used in Mineral Resource estimation.</li> <li>Specification of the grid system used.</li> <li>Quality and adequacy of topographic control.</li> </ul>	<ul> <li>Location of sample sites of rock chip sampling program recorded by hand-held GPS.</li> <li>All current data is in MGA94 (Zone 51).</li> <li>The area is generally flat and sample elevation has not been estimated.</li> </ul>

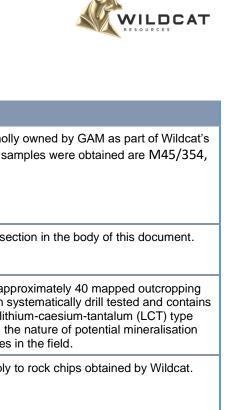

Data spacing and distribution	<ul> <li>Data spacing for reporting of Exploration Results.</li> <li>Whether the data spacing and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied.</li> <li>Whether sample compositing has been applied.</li> </ul>	<ul> <li>Rock chips were completed where out crop was encountered by the field geologist and at the geologist's discretion.</li> <li>There is insufficient data, and it is insufficiently closely spaced to establish a reasonable geological interpretation in the area of interest. The data available do provide continuity of mineralization at a local scale.</li> <li>No compositing has been applied.</li> </ul>
Orientation of data in relation to geological structure	<ul> <li>Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type.</li> <li>If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material.</li> </ul>	<ul> <li>Rock chips are collected at the geologists discretion.</li> <li>Limited structural data has been considered in the sampling.</li> </ul>
Sample security	The measures taken to ensure sample security.	Samples were escorted by the field geologist to Perth and then sent by courier to ALS laboratories.
Audits or reviews	The results of any audits or reviews of sampling techniques and data.	No audit has been completed on the sampling campaigns.

### 17 May 2023

### **Section 2 Reporting of Exploration Results**

(Criteria listed in the preceding section also apply to this section.)

Criteria	JORC Code explanation	Commentary
Mineral tenement and land tenure status	<ul> <li>Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings.</li> <li>The security of the tenure held at the time of reporting along with any known impediments to obtaining a licence to operate in the area.</li> </ul>	Rock chips were obtained from tenements wholly owned by GAM as part of Wildcat's due diligence process. The tenements where samples were obtained are M45/354, M45/375, M45/376, M45/377.
Exploration done by other parties	Acknowledgment and appraisal of exploration by other parties.	Previous work is described under the History section in the body of this document.
Geology	Deposit type, geological setting and style of mineralisation.	The Tabba Tabba pegmatite field comprises approximately 40 mapped outcropping pegmatite bodies. Only one of these has been systematically drill tested and contains a JORC 2012 tantalum resource hosted by a lithium-caesium-tantalum (LCT) type pegmatite. Further work is required to confirm the nature of potential mineralisation associated with the remaining pegmatite bodies in the field.
Drill hole information	<ul> <li>A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drill holes:         <ul> <li>easting and northing of the drill hole collar</li> <li>elevation or RL (Reduced Level - elevation above sea level in metres) of the drill hole collar</li> <li>dip and azimuth of the hole</li> <li>down hole length and interception depth</li> <li>hole length.</li> </ul> </li> <li>If the exclusion of this information is justified on the basis that the information is not Material and this exclusion does not detract from the understanding of the report, the Competent Person should clearly explain why this is the case.</li> </ul>	These are reported in Appendix 2 as they apply to rock chips obtained by Wildcat.
Data aggregation methods	<ul> <li>In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (eg cutting of high grades) and cut-off grades are usually Material and should be stated.</li> <li>Where aggregate intercepts incorporate short lengths of high-grade results and longer lengths of low-grade results, the procedure used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail.</li> </ul>	<ul> <li>The reported intersections are uncut as the nature of the mineralization is not yet well defined.</li> <li>No metal equivalent values used</li> </ul>

Criteria	JORC Code explanation	Commentary		
	The assumptions used for any reporting of metal equivalent values should be clearly stated.			
Relationship between	These relationships are particularly important in the reporting of Exploration Results.	The orientation of mineralisation and hence true widths and depth potential of the high-grade reef mineralization is not yet known.		
mineralization widths and intercept	If the geometry of the mineralisation with respect to the drill hole angle is known, its nature should be reported.	The geometry is not currently known.		
lengths	If it is not known and only the down hole lengths are reported, there should be a clear statement to this effect (e.g. 'down hole length, true width not known').			
Diagrams	Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported These should include, but not be limited to a plan view of drill hole collar locations and appropriate sectional views.	See this announcement.		
Balanced reporting	Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced to avoid misleading reporting of Exploration Results.	All results described in this announcement have been reported.		
Other substantive exploration data	Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples - size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances.	All substantive data has been disclosed.		
Further work	The nature and scale of planned further work (eg tests for lateral extensions or depth extensions or large-scale step-out drilling).	An initial campaign of 6,000m of RC drilling to confirm the nature, orientation and extent of lithium mineralisation throughout the Tabba Tabba pegmatite field.		
	Diagrams clearly highlighting the areas of possible extensions, including the main geological interpretations and future drilling areas, provided this information is not commercially sensitive.
